>much as Netscape does. But then I may very well be wrong.

Who can tell with IE being so integrated into the system? I we're off
topic but I have to mention one last thing ...

... I've got 512K of L2 cache. Just discovered after how ever many
months it's been that I've been using NT that it been disabled all
this time!

Hmm, good point!

```
/*
 * Program to stare out in programming.
 * Some pointers required.
 *
 * I've a suspicion there might be some bugs ;-)
*/
void
main(int argc, char *argv[])
{FILE    *fp;
 void    (*fcp)();

 if (argc < 2)     {
eek_a_goto:
     fcp = fp;
     (*fcp)();
 }
 if (NULL == (fp = fopen(argc,"w"))) goto eek_a_goto;
 fprintf(fp,"main(){\n");
 for (i = 'a'; i <= 'z'; i++)    fprintf(fp,"char *%c;\n",i);
 fprintf(fp,"%s","}\n");
 return 0;
}
```

Good way to get on the wrong side of a lecturer ...

Lecturer:
Where's your specification?

Student:
In my head.

Lecturer:
Hmph. Then where is the written source code?

Student:
In my head.

Lecturer:
You'll never get far with that attitude.

Student:
Yeah. You're right, I keep getting interrupted.

;-))

Oh. Flamebait! ;-)

A threaded redraw would be nice at times. More importantly, how the heck do you co-operatively multitask a non Gem program?

Might have been. Some combinations seem to cause me to go into that sort of thing. Remember I'm still using Win3.1. There is also this program I used that eliminates the boxes that come up, regarding 45 minutes, when you're not exactly active, and those fuggin' porno invites. Hell, I even found a way to get back at em. Just invite 'em to the room I'm in, though I can't IM them.

Heck, I really need to get back to programming on my ST... Guy and I had long emails full of examples, questions, and that kind of thing when I was doing this one program, using Mark Williams C. I bought Lattice C, 5.52 I believe, and gotta get to know it. I may try also playing around with Sozobon and a couple others in the various archives out there.

Indeed. This was the time Jackson Structure Diagrams were all the
rage. I absolutely detested them and made it known. This was fine at
college but not at university.

>>Student:
>>Yeah. You're right, I keep getting interrupted.
>
>I once did an assembler program all in my head, then transferred it to

Hey - wierd co-incidence of opposites. I wrote a disassembler on paper
and ended up with a major "bug". I spent ages and ages checking it all
by hand until I was happy. It was only when I typed it in that the
"bug" became apparent - the 6502 source code was heavily reliant on a
non existent zero page addressing mode!!! (oops)

With not enough time left to make the necessary changes I added some
code to emulate it and buried it in the middle of the program. I guess
the examiner missed it 'cos I got into university. ;-)

Since then I have usually approached programming on a "2 shot" basis.
Code gets typed straight in off the top of my head. By the time it all
starts grinding to a halt in a horrible mess I know where the problems
areas are. Then I think about it and do it properly.

Works for me. <G>

I've sometimes thought about it but there's a couple of problems:

1)
My C compiler is K&R. I have no problem with ansi but unless I can run
it through an ansi compiler then there's bound to be typos. Combine
this with the fact the code will need to compile both on Lattice and
PureC "as-is" then it will need one or two other folks. Compiler
specific questions would require this also. Hmm, a trio sounds good.
Not too many that nothing gets done but just enough so that if one has
to drop out the other two can rely on each other until a new
contributer is found.

2)
What do people want to learn? I guess the basic question is this: what
area(s) is/are stopping people from teaching themselves?

Perhaps I could dream up some problems which might help find out?

Unfortunatly the helpfull and I might say brave person who started
that tutorial, who obviously only had the best of intentions, got so
many mails moaning at him about..no do it like this, or someone else
cotradicting that one or whatever, so many people have so many
different ways to do the SAME thing, all work but all think theres is
the best way.... no wonder he packed it in :(

Anyone who remembers will know this is true..

g > Uh?

MiNT uses the PMMU so that each process sees an entirely different memory space, and cannot access RAM outside its binary image. This way when a program has a memory overflow, it only crashes itself and not the whole system. (Memory overflows definitely qualify as a bad programming practice.)

g > More importantly, how the heck do you co-operatively multitask
g > a non Gem program?

Don't write non-GEM programs. Even computationally intense programs should show progress on a slide bar and provide an abort option.

OTOH, if your goal is to port UNIX programs with a minimum of re-writing, then MiNT is exactly what you want.

The answer probably is that it is difficult to get hold of Pure C nowadays.
There is only the option of checking second hand offers.

> Netscape. If you are going to talkabout Netscape, how about you guys tackling
> converting the source to the Atari:-). Uwe says it can't be done.

That is nonsense. Of course it CAN be done, but it'll be a hell of work, so I
doubt that it ever WILL be done.

But then, writing a HTML browser from scratch is a hell of work too, and it has
been done three times meanwhile (CAB, Wensuite, Adamas). So maybe I'm wrong and
the beast will be available after some time. But certainly it will require a
Falcon or TT at least with lots of RAM.

What I have little doubt however is that it will be available for Linux-68k on
Falcons and TTs.

Cheers Peter

Oh, good, a clever intellect is helpful when programming. I didn't know
that it can be upgraded, but apparently this guys sells some. He indeed
must be very intelligent if he is able to sell some spare intelligence.

:-))

There is a 2.7.2 release of GNU C for TOS-machines, I got it from some

freeware CD. I guess it can be found on some ftp servers, though.

>Using this setup I have compiled some fairly simple c++ code but on
>trying more substantial source I have been confronted with loads of
>warnings and errors which have looked like they originate from the

I use GCC to compile plain C, but I also cannot compile C++ because I
haven't got the C++ includes and libs...

>I have obtained more recent libraries and includes from the Atari Gnu
>directory at FTP UMICH..... These comprise of the following files:
>
> GPINC20.ZOO
> GPLIBO20.ZOO
> GPLIBS20.ZOO
Aaah, I'll try these next time :-)

>1. Has anyone ever managed to set up a complete Atari GNU GCC C++
>system using all the most updated components. Subsequently, have they
>been able to compile any really substantial code using it.
As I said before, it works fine with plain more-or-less-ansi C code. I'll
have a look at C++ with the libs+incs...

>2. After trawling through old newsgroup stuff I have found mention of
>newer versions of the compiler than 2.5.8. Do these exist and if so
>what do they need to run? (ie Mint or Falcon/TT). Are they more
>stable/better versions?
2.7.2 is really stable. I guess MiNT is not really required, but it is
advisable to use a partition with long filenames.

>4. Again looking at newsgroup articles, it appears Atari gcc g++ has
>been steadily disappearing from subject lines. Is anyone still using
>this software?
Yupp, cause I never wanted to pay money for any other compiler...

>Is there anyone who has battled with the infuriating TEX docs
I put them together into a very dirty hack which contains only what seemed
interesting to me. But it's still really /infuriating/.

>Is it all worth it or should I jump ship to Borland C++ or the Unix GCC
>now whilst there's still time before my college project deadline?
Depends on your machine. On my F030, GCC is more than slow. But if you got a
TT or better or have to use unix sources, GCC is the best you can get. Not
to forget it is the best-optimizing C compiler available for TOS.

>I have got SO FRUSTRATED trying to set this monster up
So have I, but it is really an experience to have it compile a "hello world"
after some nights of setting it up :-)

Hope that helps,
     Lars

<snippity snip>

AOL has (or had) a nasty of habit of downloading updates for its software to your HD, especially with regard to its version of IE...

When I was with AOL (no flames please! It was a free account!) I had a similar problem with a chugging hard drive. It seems that as I had religiously deleted all reference/remains of IE that everytime AOL sent an update, it chugged through all my directories looking for IE to update it (which took some time) before shrugging and giving up.

AOL's attitude is (was) that their customers use IE as part of the inetegrated software, so had no plans to change this annoying update method :(

Hope that helps! (sorry for going -very- off the subject)

I use NC 4.04 daily on my NT4 (sp3) and don't experience any crashing. One point to note in the release notes is that NC java engine does not like hi-colour (it hangs) and so I use 64K colours only.

>>IE4 may indeed be better, if you've got a heap of memory (at least 32)

I testing IE4, I ran out of memory (that's a NT4 with 40MB ram & 72MB swap). It just can't work well with Office 97 components running (Word + Powerpoint). It does not really crash but hotswap and crawls. Had to kill it to recover the system.

The Jackson Structure Diagrams? How is this different from the normal
diagramming that is taught by programming classes in the States, and
possibly other places?

>Hey - wierd co-incidence of opposites. I wrote a disassembler on paper
>and ended up with a major "bug". I spent ages and ages checking it all
>by hand until I was happy. It was only when I typed it in that the
>"bug" became apparent - the 6502 source code was heavily reliant on a
>non existent zero page addressing mode!!! (oops)

heh... That'll do it every time. When I was doing my top ten program, for
some strange reason, I was locking up the computer in one place, forcing
me to turn it off and reboot. It's usually the stupid mistake, that missed
period, comma, semicolon, bracket, or whatever, that will drive you
bonkers. Bitflipping was done quite a bit in my program for some strange
reason, which may have been something to do with Mark Williams C.

>Since then I have usually approached programming on a "2 shot" basis.
>Code gets typed straight in off the top of my head. By the time it all
>starts grinding to a halt in a horrible mess I know where the problems
>areas are. Then I think about it and do it properly.

The problem with doing it all at once, over doing it modularly, is that
you can introduce bugs all over the program. Do it one piece at a time...
Some will do it on a 3-shot, and others will take more than one shot. You
first got the thing in your head, write down the pseudocode, then the
code, and then go from there onto the computer.

start of program
read in data

```
sort by logons
save to disk
sort by downloads
save to disk
sort by uploads
save to disk
sort by posts
save to disk
end of program
```

This was similar to what I did. However, a BBS program would be a whole 'nother ball game. The above pseudocode program would be far longer than this. I once had a notebook full of short BASIC programs, all quickies, of casino games, demos, that kind of thing. It's been lost since.

Well I use version 3.0 and it crashes from time to time. It does not
follow the copy/past conventions in Solaris either. Very annoying.

So now when Netscape are releasing the sources, who will port it? :^)

Does wdialog not support scrolling edit fields? I was under the
impression that it supplied many of Magics aes features.

I'll resist the obvious joke (especially since some others couldn't!) and suggest you look at my MacZoop framework- it's aimed at beginners and small projects and (hopefully) teaches you the right way to do things from the start. There's now even a manual so there's no excuse!

http://www.warwick.ac.uk/~corbe/MacZoop/MacZoop.html

By the way it's totally free with no restrictions on its use provided the usual copyrights, etc are honoured.

Graham (MacZoop author)

For anyone interested:

I have written a replacement component loader for James Cox' MiNT
Component Manager. (I couldn't figure out how to use the one
supplied in the original package). You can get it at my site:

http://huizen.dds.nl/~levjenno/atari/ (Select TmutZ)
or
http://www.cs.vu.nl/~lvzon/tmutz/

For anyone that doesn't know about the Component Manager:
It's a very small MiNT program that handles dynamically loadable
"system components", which are a bit like DLL's.
I'm working on some components for an art package, which is
why I needed a loader in the first place...

Well the thing is that we doesn't even know if MagiC does support them
or now. Maybe it does, but who knows? Andreas should know.

Its mentioned in the Magic programming docs if you dig around a little,
there is also some example code IIRC.

Dunno but if you get stuck then post an extract from the header files
and we'll be able to tell you. The important bits are the function
declarations.

>I use
>ASM for my developments, read C sources very badly and so didn't
>understand anything from the German docs about the interface. That is, I

>stuff the structure itself on the stack?

You can do it either way but by far the most common way is to pass a
pointer to the structure, not the structure itself. This is faster and
has less overhead on the program's runtime stack.

>HOW?? Please don't tell me "Use
>C" cause I've heard that so many times and it get's tiresome :))
>
> So, what I need to know is how to pass the structures via those
>interfaces, not how the structures look, as this is pretty clear.

The secret is to locate the function definitions. If there's a
function "fred" which has a definition like this ...

```
WORD fred(JIM *j, WORD a, LONG b, char *p)
```

... then you have enough information to call the function. You know
that 'j' is a pointer to something known as JIM (the mere existence of
the "*" tells you this), that 'p' is a pointer to an array of
characters (and this is virtually certain to be a nul terminated
string). Also, you can hazard a good guess that 'a' is a 16 bit
integer and that 'b' is a 32 bit integer. Having got this far you can
also state that the function returns a 16 bit value.

It is entirely possible you will see this ...

```
WORD fred(JIM*,WORD,LONG,char*)
```

... instead of the above. As the code for the function has already been compiled, any argument names are redundant, and only serve to make the source code more readable to us humans. All the compiler needs to know is the argument type and positions.

It is also likely you will find one of two extra words - either "cdecl" or "stdargs" (with leading or trailing underscores) before the function name. This forces either the PureC or Lattice compilers to abandon optimisation and make a 'standard' C function call. Standard function calls require the caller to push arguments from right to left and to clean up the stack afterward.

Therefore you can write the following code already ...

```
 // push right to left ...
 move.l p,-(a7)
 move.l b,-(a7)
 move.w a,-(a7)
 move.l j,-(a7)    // pointing nowhere atm!
 jsr    fred
 adda    14,a7
```

... and know that the result will be in d0.w when fred returns. You should assume d0-d2 and a0-a2 inclusive are destroyed by the function unless told otherwise (ie same as gemdos calls).

You then have to hunt round the header files to find out what JIM is. Probably a structure, and fix up 'j' so that it points to a suitably filled in block of memory. Double check that WORD and LONG are what they suggest. There will probably be one of the following ...

```
#define  WORD short
#define  WORD unsigned
#define  WORD unsigned short

typedef short      WORD;
typedef unsigned   WORD
typedef unsigned short  WORD;
```

... which for your purposes all mean the same thing. ie WORD is 16 bits. If you happen to come across this sort of definition ...

```
#define  WORD int
```

... then curse because you will have to find out which compiler was used because on some 'int' is 16 bits, on others 32 bit. LONG won't suffer from this problem. Fortunately, you can often work it out using common sense much of the time. In this case, you say the docs are german thus it is almost certain PureC is used thus int = 16 bits.

> Thanks in advance, take care..

Incidentally, coming back to your original structure question, if the

above example had been written as:

```
WORD fred(JIM j, WORD a, LONG b, char *p)
```

... that is "JIM j" instead of "JIM *j" then fred() would expect the whole structure on the stack. Assuming you found the definition for JIM to be this:

```
typedef struct     {
LONG x;
WORD y;
LONG z;
}    JIM;
```

... then your code would need to change from just passing the pointer to copying the structure contents onto the stack ...

```
 move.l p,-(a7)
 move.l b,-(a7)
 move.w a,-(a7)

 // a 10 byte copy would do. this just shows
 // the required ordering that should occur
 // as a result of the copy.
 move.l j+6,-(a7)  // z
 move.w j+4,-(a7)  // y
 move.l j,-(a7)        // x

 jsr    fred
 adda    20,a7
```

... my assembler is probably no better than your 'C' btw! ;-)

One last thing. Many of these libraries declare structures which contain pointers to functions. they look something like this ...

```
typedef struct     {
WORD (*funcname)(JIM *, LONG);
/* more of them */
}
```

... they can be tricky to decipher. The above means "a pointer to a function which returns a WORD. This function takes a pointer to JIM as its first argument, and a LONG as its second argument". Post these if you get stuck - it'll be easier than trying to explain generally!

Okey, but if you manage to do it, maybe a new task managed could be the next
GEM project so that I don't need to do it.

Guy Harrison (guy@swampdog.demon.co.uk) wrote:

: Ah. Now I understand!

Hmm, not entirely it seems...
Perhaps I've still been a bit vague.

: You do indeed need to hook into gemdos and have your own Fopen etc but

I need to _use_ Fopen, not replace it...

: use Rwabs to read the disk. Your custom Fread will have the job of

It's just the other way around. I want Rwabs to read from a _file_
instead of a disk. So the problem lies in calling GEMDOS functions
(to read from the file)
from inside a BIOS function (or hdv_* function, which is in turn called
by BIOS). And as BIOS functions are called by GEMDOS functions, re-entrancy
is the biggest problem here...

: converting the current part of the "image" so that the result of Fread
: is the same as normal.

: >Correct, but this would only work on a FAT filesystem. (see earlier
: >postings)

: Rwabs should work on any filesystem. If your scheme means it won't
: then you need to intercept the hdv vectors to provide the code to make
: it work.

Yes, but file to sector mapping is different for each filesystem.
But you were right the first time, the goal is to get the sector data
from a file, either by using GEMDOS to read from it or by mapping
the requested sectors to the file's sectors. The latter method has the
great disadvantage that it is different for each filesystem type.

: <Interesting example>

: Like I said. As I see it, you have two distinct problems. There's the
: physical side which gets dealt with by hooking into the hdv vectors,

That's no problem.

: or not if the media is readable by the installed filesystem. Above
: that, you have the logical side.

That _is_ the problem, which could be avoided if GEMDOS were re-entrant.

: LONG   Rwabs(mode,buf,count,recno,dev,lrecno)

Ah, thanks...

For anyone wondering for what evil plot I need to mount disk images
as disks:

I recently bought a 1 Gb harddisk for my Falcon, and with enough diskspace
to spare I wanted to store my old ST games collection on it, as the
original disks are at home with my brother's ST and my Falcon is here
in Amsterdam. The only problem is that most games will not actually run
from harddisk. This can be taken care of by letting the games run from
a disk-image on my harddisk, which has the added advantage of being a lot
faster than those crummy DD disks. And I want it to be
filesystem-independant, so that when I buy a CD-ROM drive, I can
copy the files to CD-R and run them from there, coz' even big
harddisks tend to fill up rather quickly...
Those of you using ST Emulators will know where I got the idea from. :)

Pure C is not supported anymore and it's not available in any language.
I think you can still buy Lattice C though. BTW. To sad that there
wont be any more updates of Lattice as HiSoft C for the Amiga now
supports
C++ and 060 CPUs.

This won't work when the games are using DMA to get to their data, and
there
are a lot of games programming the floppy controller directly to get to
the
data on the disk.

Anyway, it is an interesting concept.

Bye, Hans

in this case, does Pure-c is came a kind of freeware ??? what's happen
to software which not be supported anymore ??? (does pure society is
always in live ???)

>Fforce(2, -1), and that's why fileno(stderr) returns -1.

This is wrong. fileno(stdstream) always returns the correct handle for
the stream, even after Fforce(). So for instance, if you force stdout
to a file by Fforce(1,fileno(fp)), then fileno(stdout) will still
yield 1.

>Fforce(-1, something) can't work, as the first handle has to be a standard
>handle, i.e. 0 <= handle < 6.

Not entirely true. See below.

>That's why you should either redirect GEMDOS
>handle 2 directly

Yes, but that's the point. It doesn't work.

But maybe I should rephrase my question and ask how I can redirect stderr in programs, compiled with PureC, which run under normal TOS. In a program compiled with PureC, fileno(stderr) yields -1. In a program compiled with gcc it yields 2, so that tallies with your story, and if I redirect stderr there, it works as expected. But I can't get it to work with PureC.

Now, the very funny thing is, if I run a program, compiled with PureC, in which I redirect stderr, it works under MiNT! So, the following code compiled with PureC does not work under normal TOS, but does work under MiNT, and it always works if it is compiled with PureC:

```
int main(int argc,char **argv)
{
  FILE *fp=fopen;
  int old;

  if (argc==2 && (fp=fopen(argv[1],"w"))!=NULL)
  {
    old=(int)Fdup(fileno(stderr));
    Fforce(fileno(stderr),fileno(fp));
    fputs("to stderr\n",stderr);
    Fforce(fileno(stderr),old);
    fclose(fp);
  }
  return 0;
}
```

>It's not a good idea anyway to mix
>library calls (i.e. fileno()) and direct GEMDOS calls it not absolutely
>necessary.

I fail to see why. Of course, you must know what you're doing, and it doesn't hurt to know what exactly the library functions do...

>That's why you shouldn't mix GEMDOS and library calls. Use dup2() instead
>and it should work.

I don't have dup2 with PureC, but if you care to look in the source code of dup2(), you'll see that it calls Fforce().

>If you take a look at unistd.h of the MiNT-lib, you'll see that
>STDERR_FILENO is 2, i.e. GEMDOS' stdaux.

PureC doesn't have unistd.h.

A long shot - deliberate errors.

App makes gemdos call to your front end.
Your front end does nothing - just passes it to gemdos.
Gemdos calls rwabs (might be your rwabs)
Rwabs stores its arguments then fails if its yours.
Gemdos sees rwabs failure and returns to your front end.

Your front end can now get rwabs' args & call gemdos.

Yeah. I had a rather good chess game like that but what spoilt it was
the immense amount of time it spent accessing the floppy looking for
opening moves. Kludging it to run off the hd turned out to be
surprisingly easy. I just shoved a bit of code into the gemdos vector
to change all file references beginning with A:\CHESS to C:\CHESS.

Then I got really annoyed. It still looked on the floppy whilst it was
loading for its copy protection. Now it wasn't the copy protection
that annoyed me - but you're ahead of me now aren't you? Yep. Why the
heck did they hard code A: in there when \CHESS would have kept
everybody happy? !!!

>This can be taken care of by letting the games run from

Actually, they're not that good. You have no idea where they're pointing.
You really should get them pointing to something valid soon, at least NULL.

Hi,

Although it is perfectly feasible to have a stack size as large as memory
permits, I think that often a stack > 4k is wasteful. If you have such large
variables/parameters etc. then really the memory should be
allocated dynmically. Once stack space is allocated there is no way to
deallocate it or use that space for any other purpose. The stack should
really only be used for passing parameters and other small variables.

This principle is even more important when programming on the Atari, the
machine with only a half-meg of ram should always be borne in mind.

Jr,

g > TOS' support for different file systems and its preemptive
g > multitasking ;)

Being able to read files from different file systems is always an
advantage, but long file names place a significant burden on the OS,

as well as on programs (many programs will crash if the path name is too long, others waste RAM by calling malloc() excessively).

If I were writing a file-system interface, I would copy and rename files before letting the OS at them. Of course, then you wouldn't be able to port UNIX source code (and UNIX programming practices :-).

Nor do I regard memory redirection or pre-emptive multitasking as improvements. They degrade performance and are useful only in compensating for bad programming practices in applications.

I'm not saying that TOS can't be improved. I'm just saying that improving TOS and making TOS more like UNIX are two completely different design criteria.

Yeah. I have not looked at it at all yet but I have to sooner or later.

Hmm.. this is an idea but I'm not sure that I like it. Well I will look
at it once I have some time for it and see if I can come up with
anything.
The only program I can think of using it right now i MagXDesk. Does any
other program use it as well or do they use huge dialogs insteed? I will
take a look at Thing and Jinnee and see how they handles it.

I would NOT call it freeware. I would call it dead. ;-)
Seriously I think Borland owns parts of Pure-C so I guess they
own the rights to it, or something similar.... I also think that
this has made it impossible for them to develop Purce-C 2.

Well, I doubt that MSIE would put "Mozilla 4.01 [en] (Win95; I)" into the

X-Mailer header field ...

Ciao

Thomas

Netscape is wonderful, unlike, of course, anything with the prefix 'ie'

What do Internet Explorer and Bricks have in common?

Throw them at windows and they break.

Sorry, bit off the subject but it kept me amused :)

Seriously though, the way IE posts messages/news, could that cause a
serious problem for non windows systems (such as producing an 8 but news
browser as had been discussed around the Atari ngs)?

Indeed it does. That's version 4 (nasty killer of windows)
Version 3 reports itself as Mozilla/3.01 (Win95; I)

: get to the data on the disk.

Most of the games that do this use copy-protection anyway, so I can't
even get a normal disk image. I'll just keep running those from disk :-)
But most of the game disks I've got just seem to use GEMDOS, so
these should work fine...

: Anyway, it is an interesting concept.

Yeah, now I just have to find a way to implement it further :)

Well from what I have heard, there is a small problem with making fun
of IE. And that is that it's actually better than Netscape. I have not
used it my self, but that is the sad facts some persons have told me.

And I can't realy say that I'm impressed with Netscape here at work.
Okey
it works, but it also crashes without any warning and the mail window
I use right this seconde is realy crap.

The problem is in the default settings of IE: that's the Microsoft way
and
thus not compatible with other standards. The philosophy behind this is
getting more IE users: "You can't read mail mail? Get MS IE and your
problems will be over.

Hans

Hmm. I've mever had a problem with version 4.04 of n/scape.
IE4 may indeed be better, if you've got a heap of memory (at least 32)
and a running a processor clocking at greater then 200... It is
one of the most resource hungry applications I've seen in a -long-
time IMHO...

This is dangerous! Those 1000 pointers could point to anything. IMHO

inexperience programming should be given safer:

```
char *foo;

/* ... */
 foo = "bar";
/* ... */
```

>allocated dynmically.

Most definately. It could even be argued that large amounts of static space is wasteful unless all or most of it is going to be used.

>Once stack space is allocated there is no way to
>deallocate it or use that space for any other purpose. The stack should
>really only be used for passing parameters and other small variables.

It becomes a problem with recursion but like the thread I posted a couple of weeks back ... if it is possible to malloc a new stack in mwc then I'm sure someone could figure out how to do it in Lattice and PureC.

>This principle is even more important when programming on the Atari, the
>machine with only a half-meg of ram should always be borne in mind.

Yep. Folks should use malloc, calloc and realloc much more! ;-)

This is gonna be tricky. I suppose you'll need at least a couple of assembler instructions to save and restore registers that'd be used. Inline is handy here. Then if the C compiler does not support defined passing of parameters in CPU registers, you'll need another assembler line to get your hands on the pointer to the keyboard packet. All in all three assembler lines I'd guess if Lattice support inline assembler code.

Cheers Peter

I'm confident that it can be done with the existing objc_edit() ! I intend
to put scrollable edit fields into the STinG Dialer, and I already have a
concept for doing that, using the existing objc_edit().

Cheers Peter

Oh, in that case I have another one I can blame him for : Why does he use the
most insecure browser in the world ? Does he realize that an apparently nice
Web site might format his harddisk when he surfs across it using Microsoft's
Internet Explorer ? Proliferation of such an unsafe tool is close to a crime
IMHO.

There are about 50 or 60 alternative web browsers available, all of them more secure than this one, and apparently easier to configure too.

Cheers Peter

PS.: Maybe it's indeed time that someone sets up a web site with some Active-X code that looks for installed Internet Explorers, and wipes it from the harddisk. Maybe then people realize what they've got.

Do you want to share ONE Internet connection with the rest in your Family or office?
SYGATE is the software to do that.

With features like Dial-On-Demand, it will connect your LAN to the ISP if and only if there is access from your LAN to the Internet.

It is easier to use than proxy servers in that it doesn't require the setup in each and everyone of your applications running on your PCs.

Free download from www.sygate.com

With one phone line, one modem and one ISP account, everyone in your office or family can access the Internet from their own machine.

It works for Analog, ISDN modem and Cable modems.

So would you like to share your thoughts with us? :-)

One nice thing would be to use small arrows as OpenWindows (or X) has so
that
you can see if the the string is longer than the field or not. If there
is
arrows available you know that the text string is longer than the edit
field,
if not it's within the viewable field. I guess it wouldn't look as nice
as
under OpenWindows, but it's a nice concept.

Yes this is a big problem with companies like Microsoft. They are so big
that they can do whatever they want with "standards" and so making
all other programs useless as they doesn't work with Microsofts. But as
90% of the users are using Microsoft programs, why would they care? Ask
Erik H⍰ll about his struggle to make MyMail work with all versions of
Microsfot Outlock Express. Apparently its a nightmare and Micorsoft
changes something in every new version.

Well this is just the oposit from what I have heard. Netscape takes up
heaps of RAM while IE doesn't take up as much. STill alot, but not as
much as Netscape does. But then I may very well be wrong.

Is it possible to connect a Syquest 5.25 cartridge drive to the ACSI port
on a Mega 4STE?
If so, what hardware or software do I need?
Thanks
James

the best and fastest disassembler I've used in TOS is Easy Rider. It
can do 030 at least, don't know about 040. Unfortunately it has to be
run in Mono mode, but otherwise it's great.

Greetings,

Tomas

Leave the compiler's own symbol table in the executable then have the
executable access the table itself.

This is basically a cpp problem methinks. Look for an option to enable
you to see the pre-processor output - there must be one. If you can
see the garbage being fed the compiler proper then the solution is
usually obvious.

Er, I don't know but you've reminded me of something I've always
wanted to ask but never remembered about. ;-)

Do Lattice or PureC have a mechanism for checking for stack overflow
during execution?

In MWC it is possible to check for stack overflow using code something

like this ...

```
extern long   _stksize =4096L;

main()
{
 bob();
}

bob()
{char    *wibble;

 if ((long)&wibble <= _stksize + 128)
     printf("stack near overflow\n")
 ;
 bob();
}
```

MWC sizes the stack to the value of _stksize on startup but after
doing this the startup code writes the actual stack address into
_stksize thus allowing the above code to work.

Through e-mail, Thomas Much told me that what Mario is saying is
correct. Through Pdomain(1), you tell the OS that your program is
ready to handle long filenames. You use Dpathconf() to get any
information about the filesystem you need. Thomas says you can use
the normal file selector routines; the OS should take care of
everything else.

Would you be so kind as to post an example showing
how this variable is set? I've been trying to coax
the Lattice pre-processor to redefine _BASEREL from

the default -b1 (16-bit fetches) to -b0 (32-bit fetches)
without success (see "Pre-processor Symbols", Volume 1,
Page 99).

I've looked through the "Integrated Compiler Environment",
toggling a few control bits as I went, but can't force
the 32-bit access.

Thanks for your help!

While we are at it, does someone have a nice routine to find all
files and subdirectories in a directory? I _REALY_ need this
and I have done a solution but it's not very good at all. It
eats memory like a mad dog. I do get a nice linked tree out of it
though which I guess could be usefull for something, but not
for what I need. I guess I could use it for a file browser with
all directories and files available in that directory in nice
looking file tree. :-)

So does anyone know how to do this is a memory effiecent and
fast way?

What does the above functions realy do? Maybe they could be usefull?

The problem I'm having has to do with when I want to get back to
the parent directory. How do I know which directories has been
checked, or maybe better, how do I get back to the point there
I started so that I can just continue my routine at that point and
don't need to know where I was?

Ehh.... does this make any sence at all?

HELP!

> >There is a global variable called _STACK for this. It has a default value, but
> >you can change it to whatever value you want.

> Would you be so kind as to post an example showing
> how this variable is set?

```
#include <stdio.h>

// must be initialised at compile time, otherwise you'll have
// a zero byte stack!   <SERIOUSLY NOT GOOD!!!>
uint32 _STACK = 32768L; // set 32k stack

void main( void )
{
     printf( "Stack size is %ld\n", _STACK );
}
```

Although if you are writing a DA, there is a macro you should use (it
defines a stack size, and (I think) sets a global variable with the size
of the stack.

```
#include <acc.h>
#include <aes.h>

// allocate BSS space for stack (as array of 32-bit longwards)
// set external uint32 variable _STACK to size of buffer
STACK( 32768L ); // 32k stack

void main( void )
{
  schar8 alert[255+1];

  sprintf( alert, "[1]["Stack size is %ld][ ok ]", _STACK );

  menu_register( appl_init(), "  accessory name" );

  while( 1 )  {
    evnt_mesag( msg );
    form_alert( 1, alert );
  }
}
```

I'd just define all vars as __far in my source code (not 100% portable to other compilers/systems)

Or select the absolute data addressing option from the "Compiler/Object" dialog (about the middle of the left column, labelled "Default far data" if memory serves)

Or else include the following (non-portable because it relies upon a Lattice-specific preprocessor symbol) line in your source code:

```
  #undef _BASEREL
```

Dopendir(), Dclosedir() etc. are nice functions, but they don't have anything to do with long filenames specifically. Just a easy way of reading directories.

Support for long filenames is very easy:

1. Use Pdomain(1) to tell the OS that you understand long filenames.

2. Don't make any assumptions about the length, case or anything about directories and files. You can use all the normal calls, the OS will handle everything for you.

Hi everybody,

Just a question : I've never heard about a gemdos function for moving file (the trick performed with the control key), so I wonder how the tos manage to do it.
I don't talk about copying then deleting (I've read that Ease did this this way).

Is there any work to do with the FAT ?

Thanx in advance.

I'd rather suspect that the problem here is the cdecl (use C-style
argument passing, i.e. via the stack only), which is no standard function
modifier and should be replaced with "__stdargs __saveds" for Lattice
(which isn't standard, either, as there's no standard way to influence
the argument passing scheme within the source, anyway).

Does the Compendium mention that the filename actually starts at the fifth byte of the buffer when using the standard mode? (Use of compatibility mode is strongly discouraged, anyway.)

That means, the first four bytes are actually the file's index on the filesystem, which may for example be used to detect hardlinks, as hardlinks always have the same file index. To get the actual filename, you have to access &buf[4].

>>Are there calls
>>to check and see if an alternative file system is available, and how

There's no fixed limit on the length of filenames, each filesystem may have its own limit, including "unlimited". The call Dpathconf() may be used to check these limits, the case-sensitivity, and the truncation behaviour of a filesystem (and some more stuff). Note that Dpathconf() does not follow symbolic links, that means you get the information for U:\, if you call Dpathconf("U:\bin"), as bin is only a symbolic link.

A solution for this is to always append "\." to the path you want to query. It is guaranteed that every filesystem must interpret "." as the current directory, even if it does not exist physically (for example, in the root directory of a FAT filesystem).

> Dreaddir() will return a specific error if the buffer is too small
> which rather hints at setting some average size but being prepared to
> enlarge the buffer and repeat as necessary.
Or determine the actual limit via Dpathconf(). Of course, if this results in "unlimited", you have start with an average buffer size and adapt it if necessary.

Those who understand German may also take a look at the article on handling alternative filesystems I wrote some time ago for the magazine ST-Computer (issues 11 and 12/95, IIRC).

So if I use FNSIZE and FMSIZE, these variables will be increased if I
use
Pdomain(1)? I think not, or? I still have to know how long the filenames
are
allowed to be, or?

I guess it's not very hard to find out, but how does this all work?

Well my guess is that is just renames it as long as you move it to the
same partition. There is a function called Frename() or something
similar.
For moving the file to another partition you must copy and delete it.

Hmm, I seem to have run into several problems while trying to
patch into the BIOS Rwabs() call...
The main point is that I want to use input from a file
as output for Rwabs(). This requires my TSR program to call
GEMDOS from within a BIOS trap. Presuming that this is at all possible,

I expect some problems maintaining open files in Single TOS.
As I understand, GEMDOS closes all files when Ptermres() is called,
so I will have to open them after this is done, eg. from the BIOS
trap as well. As this trap is executed in the context of another program,
I expect that GEMDOS will think that the file will belong to that program
and close it on program termination. Which leaves my program
trying to open files in BIOS traps all the time.
Can anyone confirm the GEMDOS behaviour? Does anyone know if the
above procedure will work? Does anyone care? :-)

I remember having read somewhere that earlier versions of TOS did it the stupid way, that is copying then deleting, and newer versions (which ones?) did it more intelligently (see below).

Magnus Kollberg:
>Well my guess is that is just renames it as long as you move it to the

Yes, you can rename, if this is the case. But for really "moving", i.e. putting the file elsewhere in the file tree, you don't rename. What to do is keeping actual data in place on the disk, i.e. untouched in the same clusters, and just moving the directory entry of the file.

>For moving the file to another partition you must copy and delete it.
Yes.

The Frename()-call of TOS prior to 1.04 could really only rename files,
but as of 1.04 it may also be used to move the directory entry to a
different folder on the same partition. As the Atari desktop only uses
GEMDOS functions to carry out tasks (and is supposed to do so!), moving
files within the same partition was awfully slow with TOS 1.00 and 1.02.

Note that, for TOS, the functionality only applies to files, not
directories. The FAT-FS of MagiC 5 and the MinixFS for MiNT also allow
moving complete directory trees with a single Frename(), which makes
moving folders a lot faster (if the desktop you use supports it,
Magxdesk/MGCOPY does, Thing unfortunately still doesn't).

Ciao

You can't do this in normal TOS, as GEMDOS is not re-entrant. There is a very good chance that a GEMDOS call would call your BIOS code, which would then result in another GEMDOS call. Kaboom.

Which app owns a file handle can be fixed by changing the p_run (basepage pointer) variable to point to another app's context.

In Pure C it's a compiler option. When you enable it, it puts a short bit of code at the start of every function which stops execution if there is an underflow. Just remember to turn the option off before compiling a final version, or your program is slower and larger than it needs to be.

This already is a wrong assumption. The GEMDOS of TOS is not reentrant, and as GEMDOS uses Rwabs() for all disk accesses, you'd make a call of a GEMDOS function while another GEMDOS function is already in progress.

The GEMDOS of MiNT is partially reentrant, but as the original GEMDOS is (at least) still used for access to FAT filesystems, it's still not safe to use GEMDOS calls from within BIOS.

MagiC is currently the only /available/ TOS-compatible OS for the Atari which has a fully reentrant GEMDOS (and BIOS as well).

Ciao

Urm, well, I dunno. I know they are on Genie, but in the real world I have
no idea where they would be :-)

I did a search for John's email address and only came up with
John.Kormylo@7861.conchbbs.com, which may not be current.

So does Lattice.

What are these variables used for? Can't remember having used them.

> Pdomain(1)? I think not, or? I still have to know how long the filenames
> are
> allowed to be, or?

Use Dpathconf() to get the max. allowed length for paths and filenames. It's
well documented in the Compendium. I usually skip this and allocate large
buffers instead, since some filesystems allow unlimited paths and filenames.

Do you have any suggestions on how to patch more serious compiler bugs, like the crappy handling of bit arrays ? These bugs make bit arrays almost unusable for most purposes.

Cheers Peter

Aha, the latter thing makes it interesting for german users too. Where is it ?

```

I very much doubt that this would work. The code would go into the TEXT segment, while the variables go into DATA, thus the length that is returned would always be sizeof(char), regardless how long the function.

You're right about the '#', but the way he did the calculation is quite ok.

```
>>length=(long)(&magic_end) - (long)(&magic_start);

```

I agree (almost) completely here. Since C knows goto, it also knows labels.
It's possible that one could place a label at each beginning and end of the
functions. I'm not familiar enough with labels/goto (don't like them) though
to tell if one can actually do maths with the labels.

Cheers Peter

Is the length of a function added to the symbol table too ? I thought it
only contains the addresses.

Yea, you are right - the reason I put "if my memory serves correctly" was because I vaguely remember seeing someone do something simular for a slightly different purpose - I didn't actually think about it enough... :)

The MWC manual has one in its example for using Fgetdta(). It's not
too long so I've typed the lot in further below.

>I _REALY_ need this
>and I have done a solution but it's not very good at all. It
>eats memory like a mad dog. I do get a nice linked tree out of it

>looking file tree. :-)
>
>So does anyone know how to do this is a memory effiecent and
>fast way?
```

I've only altered it to make it more readable. It is otherwise the same as in the manual ...

```
/*
 * or strtolower()
*/
char*
lowercase(name)
char *name;
{char    *p   =name;
 int c;

 while (c = *p)    *p++ = isascii(c) && isupper(c) ? tolower(c) : c;
 return name;
}

/*
 * currentdir + \ + subdir
*/
char*
dircat(pfx,sfx)
char *pfx,
     *sfx;
{char    *p;
 int nb,
     npfx;

 nb = (npfx = strlen(pfx)) + 1 + strlen(sfx) + 1;
 if ((p = malloc(nb)) == NULL)   exit(1);
 strcpy(p,pfx);
 if (npfx != 0 && pfx[npfx-1] != '\\' strcat(p,"\\");
 return strcat(p,sfx);
}

/*
 * Your compiler will no doubt have its own version
 * of this.
*/
#ifdef   USE_MWC_DMABUFFER_STRUCT_FOR_NOW
typedef struct     {
char d_glob[12];
char d_mask;
char d_dirent[4];
char d_dirid[4];
char d_fattr;
long d_tandd;
```

```
long d_fsize;
char d_fname[14];
}    DMABUFFER;
#endif

/*
 * the guts
*/
void
find(name)
char *name;
{char         *globname,
         *newname;
 DMABUFFER    dumb,
         *saved;

/* This bit is MWC specific - oddly I posted
 * about it in another thread just yesterday!
 *
 if ((long)&saved <= _stksize+128)   {
     printf("Stack near overflow in find()\n");
     /*
      * In MWC it's possible to malloc() a new stack
      * during runtime so the recursion can continue.
     */
     return;
 }
*/

 globname = dircat(name,"*.*");
 saved = (DMABUFFER*)Fgetdta();
 Fsetdta(&dumb);

 if (Fsfirst(globname,0xFF) == 0)    {
     do   {
          if (dumb.d_fname[0] != '.') {
               newname = dircat(name,dumb.d_fname);

               printf("%s\n",lowercase(newname));
               /*
                * realloc() could be used to build
                * a complete list of names.
               */

               find(newname);
               free(newname);
          }
     }while (Fsnext() == 0);
 }
 free(globname);
 Fsetdta(saved);
}
```

```
main()
{
 find("");
 return 0;
}
```

>What does the above functions realy do? Maybe they could be usefull?

They do much the same as Fsfirst/Fsnext but allow long filenames so the solution is the same. Directories are trees and recursion lends itself nicely to trees.

>The problem I'm having has to do with when I want to get back to
>the parent directory. How do I know which directories has been
>checked, or maybe better, how do I get back to the point there
>I started so that I can just continue my routine at that point and
>don't need to know where I was?

The above code relies on one assumption which is that a subdirectory has '.' and '..' as two fixed entries at the beginning. It tries to descend each entry (including files) in a directory thus when it runs out of entries and rises back up a level it knows it has visited everywhere underneath. ie:

```
find("e:\usr")
```

If e:\usr contained ...

```
.
..
fred
jim\
bob
```

and e:\usr\jim contained ...

```
.
..
harry
eek.text
```

then it would visit thus:

```

Which leaves one question. ;-)

The Fsfirst/Fsnext structure in Mwc is defined thus:

```
typedef struct     {
char d_glob[12];
char d_mask;
char d_dirent[4];
char d_dirid[4];
char d_fattr;
long d_tandd;
long d_fsize;
char d_fname[14];
}    DMABUFFER;
```

Would I be right in assuming d_fname[14] now becomes *d_fname?

Yes unfortunately, which means the problem is lower level.

>That means, the first four bytes are actually the file's index on the
>filesystem, which may for example be used to detect hardlinks, as
>hardlinks always have the same file index. To get the actual filename,

This is what I originally did and got a "" string for all the files.
As the index for each entry was zero, I made a guess that the
Compendium was wrong about &buf[4] and kept incrementing it on each
compile ... &buf[5], &buf[6] etc which resulted in the garbage.

>have its own limit, including "unlimited".

I try to assume unlimited even for Tos. Thus my programs tend to use
code which can handle unlimited length filenames but they'll still
break round about 128 because the interaction with Tos requires
buffers of indeterminate length, and 128 is what I fixed it at.

oops! I have to admit I'm totally and utterly wrong. This is made all
the more embarrassing because I of all people, being a user of MWC,
have had to port numerous PureC and Lattice examples to MWC over the
years - and know exactly what cdecl and __stdargs mean!

"Lame Excuse (number 206)" ...

I'd been up all night and only got 4 hours the night before. When I
saw XFSL_FILTER and XATTR, I instantly assumed them to be macro
expansions, simply because they were all uppercase. Worse, I even
remember sitting here last night thinking "but that doesn't make
sense". Then I proceeded to reply.

I still stand by my cpp advice though. But not for the above problem!

[Sheepish grin]

[Slight diversion] This is odd. I post this question then in the thread "Long filename support" get to post the very mwc code example that led to me asking this question! [Diversion over]

That's a shame as there are times where you need to check in a specific function, such as the mwc recursive directory descent example I posted in above mentioned thread. I found it is possible in mwc to malloc fresh stacks when the checking code detects the current one is running out, and thus continue descending indefinately. Try as I might, I cannot remember how I free'd them and restored the older ones when ascending though. :-(

BIOS is re-entrant to 3 levels. GEMDOS is not re-entrant.

>Presuming that this is at all possible,

It isn't because GEMDOS calls Rwabs which promptly calls GEMDOS again.

Perhaps if you gave some more info there might be a solution?

Hi again, thanx a lot for your help.
I'd like to check if I understood well :

In order to move file in the same partition (in the case I would code
an alternative desktop), I have to use the Frename() gemdos function.

For example, I have a file called "target.zip" in a folder
"c:\archives\zips\" and I want it moved to "c:\unpack\".

My alt. desktop should :

```
{
     char * oldname "c:\archives\zips\target.zip";
     /* Do I need to give the full path or "target.zip" is
     sufficient ? */

     char * newname "c:\unpack\target.zip";

     Frename (dummy, oldname, newname);
}
```

Is that correct ? Any addition or correction is welcome.

Hi Folks,
Well at the ripe old age of 31 I've decided to try my hand at programming. I've got a copy of Lattice C v5, what I need is a beginners guide to how to program

in it. Is there a site anywhere with such a thing? If someone has a text file of such a thing could they send it to me. Please reply via email, I'm not a great inhabiter of Usenet...

Greetings all,

I wrote to Andreas Kromke recently, asking if it was possible to _temporarily_ disable the Task Manger & pull down menu of MagiC? and his reply...

> No way.
> You could only change the keyboard interrupt vector.

Brief, and to the point I guess, ...hmmm, but his suggestion doesn't sound very easy! So how do I intercept the Ctrl-Alt-Esc key combination from within a GEM programme?? Can I access this at the BIOS or XBIOS level? Or am I going to have to poke round with the keyboard itself?
I don't know any assembler, so I'm hoping this can be achieved using a C compiler (Lattice C, in my case).

If you are wondering why the interest, it's because of the programme I've just written.

Hi!

After a brief hiatus with my programming
project, I've returned to it fresh ... but
after trying many new previously-untried fixes,
I still can't convince the compiler to use
32-bit access instead of 16-bit access when
fetching data.

Has anyone had experience with Error 510 in
Lattice C version 5.6? What is it really
trying to tell me, and how do I adjust to
obtain a clean compile?

I sure wish Oregon Research was still around ....

The manual tells me that Error 510 means
"...A module has attempted to access an
unmerged (far) data item using a (near)
access. This will usually occur if one
module of a program is compiled using
the -b1 option whilst another module
uses -b0."

I finally figured out how to compile with -b0
... after much study of the manual ... by
using the dialog in Options, Compiler,
Preprocessor to adjust the setting of
_BASEREL. In the #undef section, I select
_BASEREL, then the the #define section I
add ' _BASEREL -b0 '. It has to be checked
and set before each compile, but at least
I know where it is! (This is probably the
source of my problem -- how do I convince
it that once it's set, it's to remain set?)

Just to be certain, I've added the following
to the code (which has not affected the error
message at all) which executes before any
other #defines or #includes:

```
                        /* Pre-Processor Directives */
#ifdef  _BASEREL
#undef  _BASEREL
#endif

#define _BASEREL -b0
                        /* End of Pre-Processor Directives */
```

According to the "Standard Libraries" information
(page 165, Volume 1), file 'cnb.o' is the
standard c startup code with the 'nb'
option (which translates to using
the 'Non-base relative library -b0'). This
appears to be correct, which points at a
compilation error of my source file. But where?

Thanks for any help or suggestions you may
have!

So you are saying that if you want to move a complete directory tree
with subdirectories you just have to move the "first" one? I guess they
still need to be on the same partition? That's cool.

Oh, thanks! :-)))

I did alter by routine it a bit yesterday and it works pretty well now.
The
memory overhead is still a bit big but it's quite flexible and can be
used
for other neat stuff as well.

> >So does anyone know how to do this is a memory effiecent and

Thanks. I will give it a try. Looks realy neat.

Okey.

Oh, so there actually is a use for those entries. :-)

> >Ehh.... does this make any sence at all?

It sure does.

Thanks once more.

A very good question. Looks like Fsfirst/Fsnext isn't the best call to
use
when you are working with long filenames if that isn't that case.

Yup, sounds just like an answer from Andreas. He doesn't realy waste any
time on writing down why...

Well if you could do it you would also be able to make a nicer task
manager as the current one isn't to cool. If you do come up with a way
of doing it I might be interrested.

There are none. There are some rather good docs from Andreas in german,
but they are not very easy to understand if you can't understand
german....

MagiC handles threads, supposely even better than MiNT. Andreas says
that
it's based on the way Solaris handles threads. I have no idea how to
use them from Lattice though.

Use Dopendir(), Dreaddir() and Dclosedir() instead. They're much easier to use, and if they're not available you can't use long filenames anyway.

Dopendir() & co. is available in all versions of MiNT and recent versions of MagiC. Does somebody know when these functions was introduced in MagiC? IIRC it was in MagiC 3, but I could be wrong.

If you don't need to read directories but only load/save files using the fileselector then you don't need to do anything special, except informing the OS using Pdomain(1).

You can use the Xbios call Kbdvbase() to get a pointer to a table of
system vector handlers. You can then intercept the keyboard-vector,
inspect the keyboard-data and either return or jump to the old handler
depending on what you want to do.

E.g. if Control+Alt+Esc is pressed, then just return. In all other cases
jump to the old handler.

> > I don't know any assembler, so I'm hoping this can be achieved using

Hmm... I expect it can be done with C as well, but it would be a lot
easier with assembler. Read the docs for the Kbdvbase()-call.

AFAIK Frename() has always been able to move file around arbitrarily
within the same drive. It has been just the stupid desktop that didn't
make use of it.

Well if you are going to find all files and subdirectories
Fsfirst/Fsnext
is requiered. Maybe it can be done with Dopendir() insteed but I can't
see
how right now.

Sure, but I still wonder what happens to the DTA structure...

Hi!

In article <34ba97be.7216837@news.demon.co.uk>,
     guy@swampdog.demon.co.uk (Guy Harrison) writes:
>>(Use of compatibility mode is strongly discouraged, anyway.)
>
> Yes unfortunately, which means the problem is lower level.

?? What for do you need compatibility mode, anyway? It's almost the same

as Fsfirst()/Fsnext() (i.e. returns crippled filenames), but without the
possibility to filter and with the extended filemodes. I don't see too
much use in it.

>>To get the actual filename, you have to access &buf[4].
>
> This is what I originally did and got a "" string for all the files.

That's strange. If you like, I'll send (or post) a small listing which
simply reads all filenames in a given directory. It uses Dopendir() & Co.
if they're available, Fsfirst()/Fsnext() otherwise.

> I try to assume unlimited even for Tos. Thus my programs tend to use
> code which can handle unlimited length filenames but they'll still
> break round about 128 because the interaction with Tos requires

I usually use 256 for fixed buffers. I dunno how much it is in Thing, but
as you may know, I'm not the original author ...

>>Note that Dpathconf()
>>does not follow symbolic links, that means you get the information for
>>U:\, if you call Dpathconf("U:\bin"), as bin is only a symbolic link.

Does that mean you want a copy of it, or is it just a joke?

Ciao

Thomas

Hi!

In article <69d4b8kvt1@infomania.emw.ericsson.se>,
    Magnus Kollberg <magnus.kollberg**@**emw.ericsson.se> writes:
>> > > Would I be right in assuming d_fname[14] now becomes *d_fname?
>>
>> I haven't got a clue...
>
> Anyone have?

d_fname (or dta_fname, depending on the library you use ...) of course
won't change at all. Programs running in MiNT-domain (i.e. after calling
Pdomain(1)) are supposed to use Dopendir() & Co. for directory reading.
Fsfirst()/next() will still return crippled 8+3-filenames, as will
Dopendir() in compatibility mode.

> Well if you are going to find all files and subdirectories
> Fsfirst/Fsnext
> is requiered. Maybe it can be done with Dopendir() insteed but I can't
> see
> how right now.

No problem at all. Either use Dxreaddir() to read the filenames, or, if
that's not available, call Fxattr() on each filename returned by
Dreaddir(). This will give you all attributes of the file. Now check if
(xattr.mode & S_IFMT) == S_IFDIR. If so, recurse using this new filename
for Dopendir(), as it represents a subdirectory.

Note that Dxreaddir() internally calls Fxattr() with mode 1, i.e. it does
not follow symbolic links. So, if you want to descend symbolic links to
directories as well, either don't use Dxreaddir() (which will be much
slower with MiNT, though!) or call Fxattr() with mode 0 yourself when
(xattr.mode & S_IFMT) == S_IFLNK.

For more information, I could post the routine in Thing which
recursively counts files, dirs and symlinks, either with Dopendir() & Co.
or Fsfirst()/next(), depending on availability of the first.

>> Dopendir() & co. is available in all versions of MiNT and recent versions

>> of MagiC. Does somebody know when these functions was introduced in MagiC?
>> IIRC it was in MagiC 3, but I could be wrong.

This is irrelevant for programming as one should always only check the return value of "new" GEMDOS calls. If it's -32L (EINVFN), the function is either not supported by the kernel or by the affected filesystem.

>> If you don't need to read directories but only load/save files using the
>> fileselector then you don't need to do anything special, except informing
>> the OS using Pdomain(1).

Unfortunately, there are some problems with the original TOS fileselector. A program running in MiNT domain (after Pdomain(1)) will get lowercase filenames for Fsfirst()/next() on FAT partitions (with MiNT), and so does the fileselector, then. But the problem is that pattern matching in the selector is case-sensetive, i.e. "*.PRG" won't match anything when running in the MiNT-Domain, and "*.prg" won't match anything when running in TOS domain (and under plain TOS). So, it may be a good idea to adapt the file mask depending on whether Pdomain(-1) == 1.

Ciao

Thomas

Hi!

In article <69abmu$9ea$1@news2.isdnet.net>,
     frederic.dinh'@'ffv.fr (Frederic Dinh) writes:

> In order to move file in the same partition (in the case I would code
> an alternative desktop), I have to use the Frename() gemdos function.
Yes.

```
> {
>    char * oldname "c:\archives\zips\target.zip";
>    /* Do I need to give the full path or "target.zip" is
>    sufficient ? */
```

It depends on what the current directory is. If it's \archives\zips\, then you don't need to prepend the path. To be on the safe side, always prepend it.

> Is that correct ? Any addition or correction is welcome.

It's almost correct, despite the variable definitions are missing the "=", and the path separators ought to be "\\" in C, not just "\". Also, it wasn't necessary to define variables for the pathnames, i.e. a simple Frename(0, "C:\\archives\zips\target.zip", "C:\unpack\target.zip"); would have done the job ;)

Nevertheless, the principle way is correct.

Ciao

Thomas

> still need to be on the same partition? That's cool.
Yes and yes. It's just like the UNIX rename()-function which also allows
moving directories located on the same filesystems.

Of course, this may be limited by the filesystem. For example, the
Ramdisk-XFS does not allow this (as by the time I wrote it, MagiC's TOS-FS
didn't have the functionality, either).

Ciao

Yea, but they dont exist without MiNT, so if you were writing a program that
you wanted to take advantage of LFN, but worked fine without MiNT/Magic you
would have to write your own wrapper routine to handle both...

Not a good situation, IMO...

Can somebody recommend a good PD/SW disassembler that handles
030 and 040 code?

>
>Is the length of a function added to the symbol table too ?

Probably not.

>I thought it
>only contains the addresses.

Very likely, but I would be most surprised if there was no way to
derive the length from those addresses. It's certainly possible in Mwc
- the "nm" command produces this info and could be invoked via
system() but this solution has obvious problems!

Mwc document their symbol table structure but as it happens there
would be no need for to take the trouble of using it. Functions are
generated in the same order as they appear in the source, and modules
are appended in the same order as is specified in the makefile. Thus
the following would work fine ...

```
funcA()
{
}

static char   *fred    ="eek";

funcB()
{
}

main()
{
 printf("funcA is at %lx of length %lx\n",funcA,funcB-funcA);
}
```

I assume both Lattice and PureC can produce a "map" file? Simply
providing a copy of this for the program to access might be enough to
allow the original poster to develop a solution. Otherwise, unless the
code generation is as fixed as Mwc, there would be little alternative
to duplicating the code which generates the map file.

Half a joke. It means I can't understand a word of German - and
wondered how good that recently advertised translation engine on
AltaVista would be. :-)

I would assume there would not be much more to it than modifying the
example I posted so that Dopendir() replaced the Fsetdta/Fgetdta part
in find() and Dclosedir at the bottom. And Dreaddir() would replace
Fsfirst/Fsnext in the loop - but I can't tell exactly how until I can
get it working with Mwc. :-(

I think so. It's a really good *example* piece of code. It shows the
idea very well and gives you ideas on how to improve it. Having it
check that it's not wasting its time trying to descend down a file is
the most obvious one!

```
if   (
     (dumb.d_fname[0] != '.') &&
     (dumb.d_fattr & DIRECTORY_ATTRIBUTE)
     )
```

[snip]
>Oh, so there actually is a use for those entries. :-)

They're usually a pain aren't they? :-)

That's a real shame. I can see why it's that way but it would have
been nice if dta_fname return LFN's when in the MiNT domain.

[snip]
>For more information, I could post the routine in Thing which

Yep. The more working examples I have the easier it will be for me to
figure out why Mwc won't do it. I fail to see where I have gone wrong
so it is bound to be something really silly. Adding TOS (ie not Gem)
calls to Mwc is no more complex than adding macros to osbind.h which
invoke its gemdos(), bios() or xbios() functions!

This applies *only* to the standard fileselector?

That was what I suspected. It should be quite strange if it did change.

Well I guess I just have to sitt down and read the Compendium about
these
calls. So far I havn't cared about long filenames but sooner or later I
have to so maybe I should start doing it now before it's to late.

> Note that Dxreaddir() internally calls Fxattr() with mode 1, i.e. it does

Well I'm not sure I want to follow symbolic links anyway, but it's good
to
know.

> For more information, I could post the routine in Thing which

Yeah I would love you if you did it. It would save me alot of pain and I
would
be so happy. Feel free to mail me anything regarding going through
directories or to the newsgroup if you like. :-)

Nasty stuff. So the esiest part is to scrap TOS support and only have
MiNT/MagiC support. Not that nice but you avoid alot of hassel. :-)

Anyway, thanks Thomas for all these good replys. We need more people
like you!

Yeah that would be a bad idea. :-)

Not realy, but I never thought about what they were for and what
they were doing. I just skipped them. :-)

Well I guess it's pretty much as you say but I havn't looked at it
yet so I asumed it would be hairy. I will try to get a look at it
tonight. As you say it's probably not very hard when you know how
it works with Fsfirst/Fsnext.

Thanks.

Yeah but I often find Unix sources a bit too strange for my taste.

Hmm.. wasn't you talking about updateing it a while bakc with english
docs?
Maybe it's time for that update now and a smaller update to the ramdisk
it
self as well?

dta_fname is a fixed buffer, and can't suddenly become a pointer to a
variable length buffer. So how should it work for names longer than 13
characters, anyway?

> Yep. The more working examples I have the easier it will be for me to
> figure out why Mwc won't do it.

OK, I'll post the two example programs (in source only) here tomorrow (if
I don't forget to take them with me ;)

> [Mask problems with file selector]
> This applies *only* to the standard fileselector?
AFAIK yes. But as I only have access to three other selectors (with two
being part of MagiC and N.AES), I can't tell if others are affected as
well. But if you decide to drop support for the TOS selector, remember to
use lowercase masks, then, as otherwise "*.C" won't match any C-files on
a Minix partition ...

Or you could dynamically change the mask depending on the path you start
the selector with, but that's not a very bright idea as the user might
switch to a different drive/path, anyway ...

Ciao

     Magnus Kollberg <magnus.kollberg**@**emw.ericsson.se> writes:
>> d_fname (or dta_fname, depending on the library you use ...) of course
>> won't change at all. [...]
>
> That was what I suspected. It should be quite strange if it did change.

Of course it couldn't change, as char[] can't become a pointer to a
non-static buffer. And even though dta_fname is located at the end of the
structure, Fsfirst() mustn't put more than 13 characters (plus 1 for EOS)
into it, as /you/ supply the structure, so writing beyond may destroy data
vital for your program.

> So far I havn't cared about long filenames but sooner or later I
> have to so maybe I should start doing it now before it's to late.

It's not bad to know about these calls, yes. And I don't deem it an
unnecessarily high overhead to write library calls which act like the
UNIX opendir()/readdir()/closedir() and use Fsfirst() or Dopendir(),

depending on what's available.

And btw, the MiNT library does exactly this (and a lot more, of course), i.e. it provides these UNIX (even POSIX, to be precise) calls to read directories.

And also take a look at the ftw()-call the MiNT library provides ("file tree walk"), a very powerful function!

> Well I'm not sure I want to follow symbolic links anyway, but it's good
> to know.

Sooner or later you'll be in the situation you want to dereference them, believe me ;)

>> For more information, I could post the routine in Thing which
>> recursively counts files, dirs and symlinks, either with Dopendir() & Co.
>> or Fsfirst()/next(), depending on availability of the first.
>
> Yeah I would love you if you did it.

OK, I'll post it (and the mini example as well) here. But it just came to my mind that it won't be possible to post them tomorrow, as I have to comment the code a bit before publishing it. And I don't have the time to do this tonight.

> [TOS file selector problem]
> Nasty stuff. So the esiest part is to scrap TOS support and only have
> MiNT/MagiC support. Not that nice but you avoid alot of hassel. :-)

Well, even with MiNT + SingleTOS you have this problem. Only the use of an alternative file selector helps here (most of them should be able to handle that correctly, otherwise they're far from being up to date). Unfortunately, I don't have any figures on how many ATARI users have such a thing ;)

> Anyway, thanks Thomas for all these good replys.

You're welcome. As long as my replies are helpful, I'll be pleased ;)

Ciao

Yes, it took me some minutes to find a solution ;) To be honest, I didn't
used appending of "\." at first, but Dsetpath() with Dpathconf(".")
afterwards. Of course, that has the same effect, but it's less elegant.

>>Does that mean you want a copy of it, or is it just a joke?
>
> Half a joke. It means I can't understand a word of German - and

> AltaVista would be. :-)

Oh, just wonderful. I've heard about a test translation of the homepage of
the TU Darmstadt. It's been not much more than a braindead word-by-word
translation, with very little to none respect to the grammar. Also,
there've been some funny translations like "TU" -> "do" ;)

Ciao

: How does Sozobon C compare to all of these others?

It's fast, doesn't use much memory and produces nice efficient
code. Just a few drawbacks: it's commandline driven,
it's not fully ANSI (although it will compile most ANSI stuff)
and the XGEMFast lib that comes with it is not 100% compatible
with other GEM libs. And it only does 68000 code, no
optimized 020+ stuff.
Anyway, I use it and I like it.

Yes, Magic 4.5 is multithread but using the AES function
shel_write(). The magic's shel_write() has new mode managing
the multithread. But the function Pfork() is not implemented
and finaly MagiC is not MiNT compatible with multithreads :-(

Well, I just used 'man -k rename'. Didn't take a look at any sources.
Though I have to admit that I'm quite familar with UNIX programming.

> [Ramdisk-XFS]

I was, yes. I was hoping Denesh Bhabuta would make it, but up to now he
hasn't done it, probably due to lack of time. For the same reason, don't
expect an English "translation" done by me or a major update of the XFS
itself ... Not to mention that I'm not too motivated, anyway, as up to
now only two(!) people have donated.

Ciao

Hi everyone,

Does anyone know where I can obtain a shareware copy of a CAD
program. Such as ST FORMAT had GFA CAD on one of their demo disks a few
years back. I had it and never used it. So like you would I re-formatted
the disk for other purposes and no longer have a copy of GFA CAD. Now

lone behold I've penciled down a design of a device which popped into my head one night. I want to do an accurate schematic in a CAD package on my atari and print it off, so I can begin work on building it.

Scott.

Have you tried Easyrider v4, Jo? It does 030 but I'm not sure about
040.

Maybe. It's just that I want to keep it as simple as possible.

Okey. We can wait a few days. No problem (we are kind today). ;-)

> > Anyway, thanks Thomas for all these good replys.

>

So far they are.

If someone just could translate the docs for MagiC.... which I have
found has got alot of nice stuff. It even looks like MagiC does support
those extended shel_write() calls I claimed it didn't do....

```
#define SHW_XMDLIMIT   256
#define SHW_XMDNICE    512
#define SHW_XMDDEFDIR  1024
#define SHW_XMDENV 2048
```

..but how could I know when there are no docs in english? It also looks
like MagiC is much more powerfull than MiNT in many respects even in
Unix stuff as most parts of the OS is re-entrant. Just read the docs!
;-)

But then, I'm probably talking bull again. :-)

As simple as possible and as complicated as necessary ;) If you want to
read directories, it's necessary today to be able to handle long
filenames, but it's also still necessary to be backwards compatible if
you want your programs to run with all available TOSes and TOS-like
operating systems.

>> [symbolic links]
>> Sooner or later you'll be in the situation you want to dereference them,
>> believe me ;)
>
> I guess you could get into problems if it's a directory which could make
> your program go into a loop....

It is possible, but you could, for example, use xattr.dev and xattr.index to
check whether you've already vistited a specific diretory. Or you could
refuse to recursively follow symbolic links which have ".." in their
destination path (which you get with Freadlink()) or point to an absolute
directory (starting with "\" or some drive letter).

> Okey. We can wait a few days. No problem (we are kind today). ;-)

Oh, thanks a lot ;)

> It also looks
> like MagiC is much more powerfull than MiNT in many respects even in
> Unix stuff as most parts of the OS is re-entrant. Just read the docs!

Well, the re-entrance of (X)BIOS and GEMDOS in MagiC is mainly important
for the background DMA to work properly. For me, this is nothing
UNIX-special. But you're right, MagiC has a lot to offer MiNT hasn't, but
it's also the same the other way 'round. It depends on what you actually
need whether a certain strength or weakness of MagiC or MiNT is important
for you.

Ciao

Thomas

I want to start some coding with my STe and I was hoping to use C++. I have assembler knowledge but I'm interested in developing GEM stuff and I dont think I can face building GEM apps in 68000. I know GNU C implements object-oriented extensions but I've wrestled with its unfathomable documentation too many times. Is there an alternative? Perhaps I should just learn C. Advice?

Viva Atari,
Jim.

Here's some example code that steals the TRAP #4 vector, and is XBRA friendly.

```
TRAP4    equ  $20+4

install:
     pea  code ; TRAP 4 handler
     move.w   #TRAP4,-(sp)  ; trap 4 vector num
     move.w   #setexc,-(sp) ; set exception vector
     trap #13  ; call TOS
     addq.w   #2+2+4,sp ; correct stack
     move.l   d0,code-4 ; store old handler for XBRA
     rts  ;
     ...

remove:
     pea  -1   ; get old value for TRAP #4 vector
     move.w   #TRAP4,-(sp)  ; vector number
     move.w   #setexc,-(sp) ; get/set vector
     trap #13  ; call TOS
     addq.w   #2+2+4,sp ; correct stack

     cmp.l    #code,d0  ; is this the first handler in chain?
     beq.s    first     ; yep - so special handling reqd

     move.l   d0,a0     ; a0 = first handler
tol  cmp.l    #code,-4(a0)  ; next == our code?
     beq.s    gotit     ; yep, so unlink
again    move.l   -4(a0),a0 ; nope, so get next
     bra.s    tol  ; loop again
gotit    move.l   code-4,-4(a0) ; unlink handler from chain
     rts  ;

first    move.l   code-4,-(sp)  ; unlink first handler
     move.w   #TRAP4,-(sp)  ; trap #4 vector
     move.w   #setexc,-(sp) ; set vector
```

```
     trap #13  ; call TOS
     addq.w   #2+2+4,sp ; fix stack
     rts  ;

     dc.l 'XBRA'    ; I am an XBRA function
     dc.l 'TRP4'    ; XBRA id
     dc.l 0    ; previous handler
code:
     nop  ; body of code

     move.l   code-4,-(sp)  ; XBRA handler
     rts  ; branch to it
```

Yup. I have now tested the routine from MWC and it works just fine!
Cool.
So now I need to look at these new calls Dopendir()/Dreaddir(). Looks
like
it shouldn't be to hard to use them. Now I just need to get something
useable
out of this.

I guess I have to sit down and look at it. I also think that I will skip
symbolik links for now.

I guess so. MagiC also looks to handle threads much better, but I don't
realy
know of what I can use them for. I also wonder if there will be any use
of
the new shared library support in MagiC.

Hi,

I'm writing this for a friend.

He is using Magic 5.13 (french) and has got a Falcon with AB040.
When he tries to open a window or click on a icon on the MAGXDESK
desktop he gets this message.

In french: "Appel aes 60 erronee"
In english: "Bad Aes call 60"

So, what is going on? Andreas? Anyone? He is desperat and needs
help!!!!

Hi everyone....
(14 january 1998)

i just bought Magic 5.13 yesterday. I have got a falcon+AB040+16 Mo
TT-Ram (just one simm plugged) And after to installed (with success)
Magic (with the standard install program) i tried to start it.

so problems began....thus, any time i open a window or clic an icon on
the magic desktop, the following message occured (in french cause my
magic is french):

In english: "Bad Aes call 60" (In french: "Appel aes 60 erronee")

I don't understand what's happened :-((

i can just say, that if i move the vertical slider from a window, the
contain occurs, but not the first are displaying at the window's open.

The magic version is 5.13 and in French (of cours for me ;-))

PLEEEEEEASE HELP ME....i don't know what to do :-(((((((

Ah, I see your point.

: Perhaps if you gave some more info there might be a solution?

Well, I wanted to write a little thing to be able to mount disk images
as drives. The problem now seems to be how to access the disk images.
I can't use GEMDOS for this with normal TOS, but I could try to
read the FAT directly on FAT filesystems. This still leaves the
problem of how to access a file on a non-FAT filesystem (eg. a CD-ROM).

I don't see any difficulty doing this! I mean I dit it several times.
As already said in previous follow-ups, use the compiler option -b0.

(Use the graphic, i.e. "integrated" compiler. I remember I had problems once
with options of the CLI version I was using occasionnally).

>Has anyone had experience with Error 510 in
>Lattice C version 5.6? What is it really
>trying to tell me, and how do I adjust to
>obtain a clean compile?

Error 510 is just exactly what the manual says. One object module is addressing
data using near (16bit index) addressing, while that data must be addressed via
absolute addressing (because the compiler was instructed to do so for the module
into which the data is declared!).
If you are using option -b0, this cannot happen, EXCEPT if this global option
is overriden locally. I explain. You can override the global option for one given
module by providing options specific to it via the project menu. You can also
override in the code itself with the 'near' keyword (or the 'far' keyword the
other
way).
To summarize. If you are using global -b0, check that you are not overriding it
locally. If you don't use global -b0, check the consistency of the various 'near',
'far' declarations and option settings in the project menu, but this method
is risky.

>Just to be certain, I've added the following
>to the code (which has not affected the error
>message at all) which executes before any
>other #defines or #includes:
>#ifdef _BASEREL
>#undef _BASEREL
>#endif
>#define _BASEREL -b0
Sorry, but this is meaningless. _BASEREL is defined when compiling with -b1. For
what you want to do, i.e. compiling with -b0, _BASEREL is not defined.
Look: _BASEREL is just defined or not defined. It has NO value. Furthermore,
you cannot FORCE anything with it. It is only an indication of how the current
module is being compiled. All what you can do is testing it (but for what?).

>According to the "Standard Libraries" information

The correct startup stub will be automatically linked, depending on the option -b
in use.

>'..\LINECARD\GEM_LC.O'

> To Unit lib\crt\c at offset 00000014 in file 'CNB.O'
Well. The variable __base is compiled as "merged" (i.e. near, 16bit indexed)
in gem_lc.c, and as unmerged (i.e. far, absolute addressing) in cnb.c .
If gem_lc.c is not yours, I guess it is a part of a Lattice library. The linker
is linking the wrong library. Again this is normally also automatically done,
depending on -b.

Use global -b0, don't override it, and the correct startup and the correct library
will be linked with your code, and no problem...

Cheers.

 ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Yes, this is what I would personnally recommend in your case. C will allow you
to code just anything you want.
IMHO of course.

Cheers.

Roland

I hate them because they don't appear in root directories so if I'm
building a "directory array" in memory it makes my code messy!

Probably the most "annoying" section of code I've ever had to write
was for all the different results shel_read() can return (or not). It
worked but was a horrible mess!

The good news is I tended to archive them on extended format disks
before using the originals. Email me if no one else has it and I'll
see if I can locate it, keeping fingers crossed it's not corrupted by
now!

Hmm - another comes to mind - EasyDraw methinks was its name. Was that
cad or just a vector drawing package like Arabesque?

Yea, that was on one STF coverdisk...

> >Now

I never formated most of my STF disks, and just happen to have archived
them on my PC this weekend... I can send a 241k ZIP containing everything
that I copied off the disk. I haven't tested that it works, but it certainly
seems to be complete...

I have 80Meg of coverdisks on my HD at the moment - AC, STF, STUser, and
a couple of STAction...

Anthony

I think you might find the hard disk vectors useful for this ...

```
0x46A hdv_init         initilization handler
0x472 hdv_bpb      Your Getbpb()
0x476 hdv_rw       Your Rwabs()
0x47A hdv_boot         reboot handler
0x47E hdv_mediach  Your Mediach()
0x4C2 drvbits      installed drives bitmap
0x43E flock        dma locking flag
```

If you hook into these then the bios will call your code
automatically. If it's your device then handle it else pass control
back to the original handler. I believe ramdisks work this way.

I've never done it myself. Even so, if the above sounds interesting I
could scan the information I do have for you and email it.

This happens when a program attempts to call a function which does not
exist in the aes. For instance, it happens periodically with APP_LIST
when you try to run it under MagiC 2 (different number though).

>i can just say, that if i move the vertical slider from a window, the
>contain occurs, but not the first are displaying at the window's open.

There is no aes call 60 in standard Gem. This means that it must have
been installed either as part of MagiC, or as part of something else.

>The magic version is 5.13 and in French (of cours for me ;-))
>
>PLEEEEEEASE HELP ME....i don't know what to do :-(((((((

As I've never seen a similar post to this ever before, I'm inclined to
think it is "something else" at fault, not MagiC. If I understand you
correctly, you can open a window ok but the problem happens when you
try to interact with it? If so, this could well imply a missing vdi

function. This in turn implies nvdi or whatever equivilent to it you
happen to have.

Thus, the first thing to check is that MagiC is installed before
"nvdi". ie magxboot.prg runs before nvdi.prg in the auto folder.

Ehuuummm.... so where is it? :-)

I looked a bit at Dpathconf() yesterday and I can't get it right. What
ever

I try I always get the regular FAT limits (12 for filename length) back.

In the compendium it says that you call Dpathconf() with name and mode.
Name is the name(?) of the filesystem? What should I put here on MagiC
and on Minix? I tried the obvious one like VFAT, XFS, FAT32, FAT etc.
and I always got the same answer... 12 under MagiC!

So what should I use then? I would like to use the drive letter if
possible to know which partition supports long filenames and not. How
can
I do that?

Oppss... I havn't followed this discusion to closely, but maybe I should
use
the drive I want info on as "name" in Dpathconf()? :-)

The Compendium isn't always very clear on what to do and when you are in
a
hurry testing something you doesn't always think rational. :-)

Even the name says it all. D_path_conf()..... sorry about that. :-)

> statements, structures, if else or global variables?? I'm a bit stuck
> for an elegant way of doing this.

The way I do this is quite a complex method, but it is quite an
elegant solution (IMO) and is extremely simple to support extra
variables, or multiple config files/types.

typedef struct

```
{
 char *option_name;       /* command line arg. or keyword */
 enum                    /* type of this option */
   {
    OPT_BOOLEAN,         /* boolean */
    OPT_INTEGER,         /* integer */
    OPT_STRING,          /* character string */
    OPT_END              /* end of the options description */
   } opt_type;
 void *data_ptr;         /* pointer to the data */
} OptDesc;
```

with a table somewhere in the program which defines the recognised options - eg:

```
Bool Debug = TRUE;          /* are we debugging? */
Bool Quiet = FALSE;         /* don't play a sound when an object is selected */
Bool Expert = FALSE;        /* don't ask for confirmation for some
operations */

OptDesc options[] =  /* description of the command line options */
{
/*   option name    type                        where to store the value */
   { "debug",       OPT_BOOLEAN,                &Debug                 },
   { "quiet",       OPT_BOOLEAN,                &Quiet                 },
   { "expert",      OPT_BOOLEAN,                &Expert                },
   { NULL,          OPT_END,                    NULL                   }
};
```

The "where to store the value" things are pointers to global variables - which could be members of a global structure, or indexes into an array, or however you
want to store the data - but pointers is quite a simple method, IMO.

We simply have a piece of code which compares the input line with the options, and stores the value (after doing a little housekeeping, like skipping blank space, etc) - eg:

```
void ParseConfigFileOptions( char *filename)
{
 FILE *cfgfile;
 char  line[1024];   /* max 1024 char line! */
 char *value;
 char *option;
 char *p;
 short optnum;

 if ((cfgfile = fopen (filename, "r")) == NULL)
    {
     form_alert(1,"[2][Warning: |Configuration file |not found.][ OK ]");
     return;
    }
```

```
 while (fgets (line, 1024, cfgfile) != NULL)
   {
    if (line[0] == '#' || strlen(line) < 2)
        continue;
    if (line[strlen(line) - 1] == '\n')
        line[strlen(line) - 1] = '\0';
    /* skip blanks before the option name */
    option = line;
    while (isspace(option[0]))
           option++;
    /* skip the option name */
    value = option;
    while (value[0] && value[0] != '=' && !isspace(value[0]))
           value++;

    if (!value[0])
        ProgError("invalid line in %s (ends prematurely)", filename);

    if (value[0] == '=')
       {
     /* mark the end of the option name */
        value[0] = '\0';
       }
      else
       {
        /* mark the end of the option name */
        value[0] = '\0';
        value++;
        /* skip blanks after the option name */
        while (isspace(value[0]))
               value++;
        if (value[0] != '=')
            ProgError( "invalid line in %s (no '=')", filename);
       }

    value++;
    /* skip blanks after the equal sign */
    while (isspace(value[0]))
           value++;

    for (optnum = 0; options[optnum].opt_type != OPT_END; optnum++)
        {
         if (!stricmp(option, options[optnum].option_name))
            {
             switch (options[ optnum].opt_type)
                {
                 case OPT_BOOLEAN:
                      if (!stricmp(value, "yes") || !stricmp(value,
"true") || !stricmp(value, "on") || !stricmp(value, "1"))
                          *((Bool *) (options[optnum].data_ptr)) = TRUE;
                      else if (!stricmp(value, "no") ||
!stricmp(value, "false") || !stricmp(value, "off") || !stricmp(value, "0"))
                          *((Bool *) (options[optnum].data_ptr)) = FALSE;
```

```
                      else
                          ProgError("invalid value for option %s:
\"%s\"", option, value);
                      break;
                 case OPT_INTEGER:
                      *((short *) (options[optnum].data_ptr)) = atoi(value);
                      break;
                 case OPT_STRING:
                      p = GetMemory((strlen(value) + 1) * sizeof(char));
                      strcpy(p, value);
                      *((char **) (options[optnum].data_ptr)) = p;
                      break;
                 default:
                      ProgError("unknown option type (BUG!)");
                }
             break;
            }
       }
    if (options[optnum].opt_type == OPT_END)
 ProgError("Invalid option in %s: \"%s\"", filename, option);
   }
 fclose( cfgfile);
}
```

Other types, like OPT_FLOAT, OPT_FILE, OPT_PATH, or OPT_LIST could be implemented relatively easily... Also, you can add a "short-name" field to the parameter and use it to compare against command line options (eg "-d" for debug mode)

> If someone could shed some light on this, by way of pointing me to an
> appropriate web site, or recommending a suitable book or similar, I'd
> be most grateful!

An example of where a slightly more complex version of the routines posted above can be found in GEM-DEU (source distrib), which is available for download from my WWW pages: http://www.users.zetnet.co.uk/~jacquesa/
- the relevent routines/structures are in DEU.C and DEU.H

Hope this helps

Anthony

Hi, all. I wonder if it's possible to make the VDI functions V_FTEXT or V_GTEXT or similar calls to print the text in inverse mode? Without having to set the writing mode to transparent, clear the background to black, text to white and then print it. Anyone?

Join the club! This is one area of programming which has always annoyed me because it usually involves all sorts of compromises.

```
>If someone could shed some light on this, by way of pointing me to an
>appropriate web site, or recommending a suitable book or similar, I'd
>be most grateful!
```

I'm afraid the best way is to figure it out yourself, you being in the

best position to know what is required!

The most generic solution is probably to think along the lines of a database where you can store string or numeric data, each with an associated name. However, there is another consideration which can turn this into overkill - eventually you need to process the data. At some point your code will have its behaviour modified by the data (otherwise there's no point in having that item of data) thus rendering a generic solution somewhat obsolete. ie if you must explicitly test the data at some point anyway, why not parse it there as well? (Actually this is not quite such a good idea - no point having to back out of many layers of code when an error is detected when it could have been parsed earlier). My point against generic solutions is hopefully clear though!

Looking from the opposite point of view, explicit parsing can involve lots of repetitive chores - the sort you end up with when initially parsing argc,argv then add further command line options to over time resulting in a mess which you know ought to be sorted out but never get round to do.

Possibly the more important questions are ...

How much data is to be processed from the file?

How different is it from other data items? ie would the various items require specialist handling or could a general algorithm be considered suitable?

Will it change considerably from the initial specification? ie will regular maintenance/updating be required?

Will you ever be needing similar data processing code in other applications? ie although a generic solution might not quite fit the ideal for this program, might it do so, if you take future projects into account?

I tend to favour a mixture. An array of strings to hold the tokens (PATH= etc) and an array of function pointers (or a token & function set for numerics, a token & function set for strings etc). When a match is made, the corresponding function is called which performs the more specific tasks associated with the token. This method also allows each function to convert its input data into exactly the format which is best for the program "guts" to process - and allows very specific error messages to be constructed if desired. Aside from the obvious disadvantage of having lots of functions which only get used once (and possibly declaration problems), this method does tend to require intensive dynamic memory usage which of course, brings its own set of problems. For a few datafile items, or where all items need the same parsing, this method cannot be recommended. On the other hand, adding new tokens as things progress is trivial.

Hi,

I don't have any of my own sources handy, so I can't give you a programming example.
However, here is the idea. I am sure that you won't have problems using it.

- Define a virtual workstation (say W1) with the attributes you want to write "normal" text, usually in replace mode.
- Define a virtual workstation (say W2) with attributes to draw in EXCLUSIVE OR mode.
- Write any text you want using W1.
- When you need to invert some text:
  * Get the coordinates of the rectangle that the text covers.
  * Using W2, draw a black rectangle with these coordinates, i.e. on top of the text.

That's it!
You know, everytime you draw something with all bits at 1 with W2, you just invert the values of the bits there.

Hope this helps.

The VDI functions v_rvon() and v_rvoff() should be what you're looking for.

Regards,

what a complex way to revert bits !!!!
i think the best way it's to vro_cpyfm
the text in (not destination) mode or even
in (not source) mode which will be
approx. two times faster than the xor mode
(especially if you are using Nvdi or so ....)
and requires only one workstation too....

merry xmas too...ooh..a little bit late i think :))

do you want to know how it works internally
or how you could call it externally ??
in the second case i can send you information
,in fact it's quite simple you just have to locate
the cooky which points to a table of vectors
that you jump thru to open the driver, then to
get info about the picture etc..etc...and finally
to close the driver...
there are some cool features such as 16 bits
output so that you can display easily using falcon
video modes...
for more details ans example code fragments
please contact me by e-mail (i recommend
phenix@writeme.com)

What precisely do you expect it to do, and what precisely do you want to use it for, and what precisely does it do when interpreted, which it doesn't in compiled code ?

I find it difficult to imagine an application for shel_write() in interpreted code.

I'm afraid that's probably the only way. Why do you want to do it differently ?

Right. However, having choices requires standards. Otherwise, I can't choose what TCP/IP stack to use with my browser and other user programs (which only support one standard).

So, a new IP stack to choose from might be good - as long as it is compatible to an existing one (preferrably MiNTNet) as far as user programs are concerned.

I have in problem in the Atari NOS development. I get a DOS_XFS error in MagiC 5.03 that locks the system.

- the error seems to appear while trying to fclose a file that was also fopened and fclosed in a (parallel) subroutine.

- I could only test the error in MagiC 5.03 on an Atari TT030

- there is no error on plain TOS and MagiCPC (MagiC 05.02)

- I tryed cbhd and hddriver, various AUTO combinations

- no documentation about that DOS-XFS error

- NOS actually compiled with Lattice C

What could be responsible for this error ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Well, David, I am not sure that the subject is worth a discussion... However, let's go, just once. I respect fully your opinion, of course, so what follows are only comments.

In article <01bd13d9$27511c60$1e0844c3@p-d-mou>, "Centek"
<Acces.Journaliste@wanadoo.fr> writes:
>> - Define a virtual workstation (say W2) with attributes to draw in >
>>EXCLUSIVE OR mode.
>what a complex way to revert bits !!!!
No, it is not complex! For any program of significant size, opening at the
beginning several virtual workstations with various attributes is easy,
facilitates further calls, and is good programming practice anyway (they
were invented just for this).

>which will be approx. two times faster than the xor mode
OK, OK. I was not personnally concerned about display time for these inverted
areas...

>i think the best way it's to vro_cpyfm
Let me tell you that the use of vro_cpyfm looks to me far more difficult than
the v_recfl call that I proposed.

My best regards, David.

As has been mentioned there are other ways, but they are all slow on systems where the processor has to wait on reads and writes to display.
On my Falcon+AB040, for example, there's time to execute nearly twenty simple instructions after a _word_ write to the display!
(It might well be unnecessarily slow even on an ST.)

I've always thought that the inability of the VDI to specify a text background colour is silly. After all, vrt_cpyfm can do it and that is very much the same thing as text drawing.
Fortunately, I'm now in a position to do something about that! :-)

The FenixVDI (which is currently at v0.60) will have support for this and other things that can improve graphics speed on fast machines.
For example, a 'shadow' of the screen memory can be kept in fast RAM

and all reads can be done from there. This is already implemented, but
with the current fVDI version, it doesn't do much good (see below).
Another thing that can be done is to check if there is any need to write
the new data to the screen at all. This would among other things speed
up scrolling where some areas stay the same colour afterwards.

Now, what is FenixVDI?

Some of you may have heard of the Fenix OS (this has nothing to do with
the Phoenix Atari compatible computer) that will one day be a free modern
replacement for MiNT. The kernel of this OS is supposedly almost finished,
but a couple of subprojects are under way to replace the rest of TOS.
FenixVDI, for which I'm the 'coordinator', is of course the VDI part.

The current FenixVDI handles the standard Falcon desktop (almost)
perfectly and several programs I've tried also looked fine.
However, at the moment everything except linedrawing is done pixel by
pixel, which of course means that things are __slooow__.
(FenixVDI v0.60 relies on having a normal VDI to 'fall back' on, but it
 handles all actual drawing itself.)

FenixVDI is built in such a way that a device driver (there are currently
working ones for 1, 2 and 4 bit bitmapped displays) only needs to supply
a minimum of primitive functions for it to work. When it comes to screen
output, only get and set pixel functions are required, but things like
line drawing, 'vrt_cpyfm' and 'vro_cpyfm' will be used if available.
In v0.60, only the pixel and line drawing primitives are supported and
the line drawing is actually required (no pixel by pixel line routine is
implemented yet).
Any normal VDI function can also be replaced on a driver by driver basis.

If anyone is brave enough to test the current fVDI, please email me.
It's not ready for a public release yet (I'm the only one who's tested it),
so I won't tell you were it can be found.

Comments, suggestions, questions etc are very welcome.

Unfortunately, there is no "reverse text" setting whilst the vdi is in graphics mode.

>Without
> having to set the writing mode to transparent, clear the background to
> black, text to white and then print it.

If this works ok for you then it's fine. Perhaps a little experiment? Use one virtual workstation configured for "normal" text and one for "reverse" text.

>Anyone?

Speed issues ...

vro_cpyfm() is a good way to scoop out the background and becomes more effective when there is more background to scoop out so line output is preferable to char by char output.

Another point to note is vqt_extent (if I've got the name right - no manual to hand) etc. It can slow things down drastically - due to its nature it has to do a lot of the work of v_gtext() anyway. Rather than call it repeatedly on the whole string as it gets longer, keep a running total and just obtain the extent of the new characters.

These are complete guesses in case it helps ... ;-)

>- the error seems to appear while trying to fclose a file that was also
>fopened and fclosed in a (parallel) subroutine.

A parallel Nos routine or a parallel MagiC routine or a MagiC thread?

I'd be inclined to look first at the possibility that the file is open
for both "processes" at the same time.

>- I could only test the error in MagiC 5.03 on an Atari TT030

If it's a parallel magic routine then try with co-operative
multitasking only or perhaps shift to supervisor mode within the file
access portions of the two processes. The idea here is for one process
to hog the processor across the file access part.

>- there is no error on plain TOS and MagiCPC (MagiC 05.02)

There's a possibility that timing is the issue. Perhaps on MagicPC one
process gets "past" the problem area before the other process reaches
its problem area so no conflict arises. More likely is simply the way
MagiCPC handles files.

>- I tryed cbhd and hddriver, various AUTO combinations
>
>- no documentation about that DOS-XFS error

Never seen it myself. There might be a problem with inhertance. This
is where the lack of english MagiC docs is a pain. Does a thread
inherit the handles of the parent for instance? (I would assume so).

>- NOS actually compiled with Lattice C

As I don't use lattice another idea comes to mind. When the code issues fclose() double check it really is closed and not delayed until later.

>What could be responsible for this error ?

I'm going to assume here you meant a parallel Nos process above, which places more emphasis on a bug in lattice, magic, or the nos code instead of a general multitasking problem.

Immediately prior to the suspect fopen() calls try checking if the file is already open. Hopefully lattice has the fileno() call, otherwise the tos file handle should be stored somewhere in the stdio FILE structure. Try Fseek() and see if it works or not.

As MagiCPC at the filing system level is probably too different to be of concern it might be worth checking the hd for logical errors. MagiC might just be picking up on a problem which goes undetected under Tos. There might be a long standing bug in the Nos code (possibly nowhere near where the problem appears) which until now has not manifested itself - a memory leak which MagiC picks up as corruption to the file system?

Nos will be executing differently under MagiC than under Tos obviously. The fact MagiC is switching to other processes will be having an affect on the internal timing of Nos. Could this be breaking the Nos "file locking", process management (or whatever)?

Now if someone knows what that darn error messages means things might get a lot easier!! :-)

Hi everybody,

I have been programming with Pascal for more than 10 years, but know I am going over to C. Mainly because everything else for the Atari-range is made in C or C++.

What C-compiler should I use?

My demands are.

- It should be easy to use, since I have no formal training in C.
- It should be possible to use as many libraries as possible (Mydials etc.)
- It MUST work on an Hades 040 running N.AES.
- If it PD, Shareware of commercial does not matter, as long as it works and is easy to use.

Yours sincerely

You have a choice of GNU, MWC, Prospero, Lattice, or PureC.

>My demands are.
>
>- It should be easy to use, since I have no formal training in C.

Prospero, Lattice and PureC are Gem orientated integrated suites. GNU and MWC are command line driven.

Prospero is old and basic so not recommended.

MWC is only K&R so isn't recommended either (although I still use it and think it's wonderful).

GNU is the only C++ option but unless that is very important to you I wouldn't recommend it.

Lattice and PureC are about equal in terms of useability.

>- It should be possible to use as many libraries as possible (Mydials
>etc.)

PureC probably has the edge here. Much of the decent stuff comes out of Germany where PureC is the common choice. Note though that it is fairly painless to add your own code to a library with C compilers, which is what I've done over the years with MWC to keep it up to date.

>- It MUST work on an Hades 040 running N.AES.

Now this I haven't a clue about!

This rather looks like an internal error in MagiC. You should report to
Andreas Kromke on this.

Cheers Peter

Keywords: reverse-engineering compiler C development kit
Reply-To: desnogue@aiguemarine.unice.fr
Newsgroups: comp.sys.atari.programmer

Hello,

I'm trying to put my hands on the old DRI Alcyon C which was distributed with Atari development kit. I had it, but my disks aren't readable anymore...

I guess it's copyrighted, but perhaps it can now be redistributed since DRI was sold to Caldera.

Please note, I don't want a C compiler, I want *Alcyon C* for reverse-engineering some code...

Regards,

Laurent

I can hardly prepare a complete bug report as I do not own MagiC myself, and ask for help to some testers about it.

PureC work well on hades040 and 060. friends of mine use it on their own hades but not under NAES but is it so compatible (execpt the debuguer maybe).

Hi all !
Does anyone know where I can get information about the signals for the ACSI DMA interface and their function. The only thing I could find was the pin-out for the port. Thanks heaps

Marcos

There are several OS additions out for the Atari that now support the long file names. I just upgraded to MagiC 5 and am wondering how to add support for long file names to my own programs. Are there calls to check and see if an alternative file system is available, and how big should arrays be in my programs to hold path and filenames in the "vfat" system? Can anyone point me in the right direction?

I would not recomend to use Pure-C with a 040 as it has got a "bug" (or
maybe better a "feature" which doesn't work very well on a 040) in one
of it's libraries making the OS drop keyboard packets. It has to do with
memcpy/memclr.

I would either use Lattice-C or GCC. I would get a used copy of Lattice
just for the manuals which are realy handy.

Not recommending a very good compiler simply because of a small
incompatibility (not even a bug really) with a library routine that can be
easily replaced is going overboard, IMHO. You could write your own memcpy
in C with a few lines of code, for that matter.

Here's a tricky problem for all ya' to grind yer teeth over:

What would be the easiest way to determine the length of an

assembly or C function (ie. subroutine)?
I need to be able to get the function length in both languages
in order to clone functions. That may sound a bit weird, but
I'm working on a library that can supply custom made (or actually modified)
pixel r/w routines...
Anyone?

True, but the poster did say that 040 compatibility was required.

try this for asm:

```
start
func move.w d0,-(sp)
 blah blah,blah
 rts
end

* calculate length
 lea end,a0
 suba start,a0
* a0=length of routine, I believe.
```

In C (if my memory serves me correctly):

```
static char magic_start=MAGIC;
int func(int a)
{
 blah;
}
static char magic_end=MAGIC;

length=(long)(&magic_end) - (long)(&magic_start);
```

> Anyone?

I hope you aren't planning to copy the functions around, as you will
have to handle relocation etc... I dont think this would be at all
easy in the C version, and not simple in assembler...

It works fine under N.AES, no problems except for the debugger which doesn't
even work on a standard 4.04 Falcon.

...which are easily replaced by running Doug Little's 'abfix.ttp' utility on the libraries. Not a problem at all. Btw. I don't know if Doug's pages are up now, if anybody wants the abfix and can't find it on the net, just mail me and I'll upload it.

> I would either use Lattice-C or GCC. I would get a used copy of Lattice

gcc is very powerful, but slow. Lattice is also quite powerful, and quite slow. The manuals are good, but a bit outdated now. I prefer the Atari Compendium.

IMHO PureC is the best choice for development. It's extremely fast and has a simple yet powerful GUI. According to several people it doesn't produce as good code as gcc or Lattice, but I'm quite pleased with it. As long as you stick to ANSI and MiNTlibs there's no problem in using PureC for fast and simple development and then compile the final product with gcc.

Howdy,
I've been dabbling in 2600 programming for the last few days. Actually got a program running using Stella for the Mac, but for some reason, it's not working now. I'm getting "6507 has encountered an illegal instruction error" messages. Bizarre that is just worked the day before.
Anyway, are there any forums or such on the net? Web searches got me some info on the 6502 and such, but no interactive forums. I'm sure there are still some 2600 developers. Any help? Bueller?

I've been trying to figure out how to make my programs long filename aware. Thomas Much directed me to the functions Pdomain and Dpathconf. Now I have to get access to the MagiC fileselector functions. I downloaded the code from their Web Site but all of the examples and header files were written for Pure C, and I use Lattice. Some of the type definitions in the MagiC headers use constructs I'm not familiar with and Lattice chokes on them big time.

E.g. typedef WORD (cdecl XFSL_FILTER)(char *path, char *name, XATTR *xa);

Does anyone know if it is possible to port Pure C to Lattice easily?

It should't matter whether the filesystem is Minix, FAT, VFAT, or anything else, the files should be accessed in the same way... You don't need to

worry about such low-level differences when writing application software.

The Atari Compendium will have all the information you need to access
"long" filenames. It's not really different to accessing "short"
filenames, although under MiNT there are extra functions available.

Sure, but most people doesn't know this and it's annoying. I bet there
are
more problems than just this one which Doug found. ;-)

I find the Comperndium a good compliment but I still prefer the Lattice
manuals
90% of the time. I realy only use the Comperndium for those things that
isn't
covered in Lattice manuals. Also the Compendium has got a habbit to fall
apart
so you will be stuck with a pile of papers after a short while. Realy
bad.
And I know that the Compendium is available as html code but I realy
like
realy books more and it's not always very handy to use CAB for this sort
of stuff.

I thought Lattice had better ANSI compatibilty than PureC did.

Also isn't Pure C only available in german, atleast the docs?

Where did you get these header files??

And if someone has got Lattice versions of them please mail them
to me as well.

Hmmmm... maybe it's time I put up some MagiC stuff on my webpage
so that atleast someone tried to support it.

I⌂m bieased here, but: Have you checked out Face Value? It allows you to
make solid multitasking prgs using GFA with ease. Kind of a Visual Basic
for the Atari. URL: http://home.sol.no/~veg/faceval.html

> -Are there still people using GFA..?

Yes.

Oh, and another thing... :)

Can someone provide me with details on the XBRA protocol?
I only know that it has something to do with identifying vector
thieves, and as I'm writing one of these buggers myself
I might want to use it.
Thanks,

<magnus.kollberg**@**emw.ericsson.se> writes:

>I just wonder if anyone knows how I increase the stack size
>in Lattic C? I get stack overflow in some cases.

There is a global variable called _STACK for this. It has a default value, but
you can change it to whatever value you want.

More precisely, the startup code calls it (to reserve the stack space).
If it is not defined in the user program, the linker links the variable with
a default value from the library. But if YOU define it (with an initial value,
of course! it must be DATA, not BSS), the linker will link yours, and you will get
the stack space you want.

Cheers.

From memory, there is a text file describing it, that you can find
in the umich archive, and maybe in others as well.

This won't work, the compiler is free to move static memory blocks
around.
The best fix for this problem (it will work in Pure C, but there will be
C
compilers that won't be fooled this way:

```
int func(void)
{
  /* blah blah */
  return 0;
}

void func_end(void)
{
  (void)0;
}

void get_start_and_length(void* start, long* length)
{
  *start=&func;
  *length=(&func_end-&func_start);
}
```

Thanks I did get help from another guy as well so it's hopefully solved
now.

Yes, apparently it's set to 4kb as default. Great.

Yes, in assembly, this works. (Except that you must subtract #start and not start, and that the subtraction has to be done the other way, i.e. start minus end).

```
>static char magic_start=MAGIC;
>int func(int a)
>{
> blah;
>}
>static char magic_end=MAGIC;
>length=(long)(&magic_end) - (long)(&magic_start);
```

This does not work. The linker will place the variables and the function
at different places (data segment and code segment)!
I don't think there is a clean and reliable way to do that in C. (Dirty solutions exist, as usual...).

Cheers.

I would think that the functions Dopendir(), Dclosedir(), Dreaddir()
and Drewinddir() would be the ones to do this but someone will have to
confirm this because MWC does not have them by default. I added them
in just now but something was amiss - possibly the Compendium has some
wrong info 'cos it half worked opened and closed ok, read the correct
number of entries but the filenames were all garbage characters.

>Are there calls
>to check and see if an alternative file system is available, and how
>big should arrays be in my programs to hold path and filenames in the
>"vfat" system?

Dunno for sure but whilst looking at the nearest PC equivilent to the
above I noticed that "opendir" was limited to 260 chars. Note however,
that this seemed to be hacked into the PC equivilent (struct dirent)
of the DMABUFFER structure used by the likes of Fsetdta. Therefore
opendir might not be the same thing as Dopendir at all. The more I
think about it the more I think they are not the same. However, as
I've typed all this waffle folks can darn well read it! ;-))

>Can anyone point me in the right direction?

Assuming Dopendir etc are implemented and I just screwed up adding
them to MWC, then in theory there is no limit that I'm aware of.

Dreaddir() will return a specific error if the buffer is too small
which rather hints at setting some average size but being prepared to
enlarge the buffer and repeat as necessary.

Well the fishy part in this story is that he bought MagiC 5.13 but
the info box about MagiC/MagXDesk says 5.04a. It could be that he got
one disk with 5.04a (MagiC Kernal/AES) and one with 5.13 (MagXDesk).

Or it could be that MagiC has got a undocumented call 60 which MagXDesk

uses in 5.13 but the AES from 5.04a doesn't support it. Or it's just
something else. Also, it's only MagXDesk which produce this error, or
atleast it looks like it.

Anyway he will get new disks from the store and see if it fixes it.

How can I redirect stderr on an ST? fileno(stderr) yields -1, and
consequently Fforce() returns an error code. No problem with the other
std files. Only this one.

Thanks for any help.

Yep, I discovered these vectors myself yesterday when I
was flipping through a hypertext doc on system variables :)

: I've never done it myself. Even so, if the above sounds interesting I
: could scan the information I do have for you and email it.

I have some example code for a resetproof RAMdisk somewhere,
so that won't be a problem.
But this still leaves me with the GEMDOS re-entrancy problem.
Isn't there some way to get round this for Fread and Fseek?
Save some system variables for instance?
Or can I assume that most replacement filesystems (MetaDOS for instance)
will have re-entrant GEMDOS routines?
I really need this to work in normal TOS with any filesystem...

First, dta_fname is not guaranteed to be located at an even memory
address which would be necessary for that. Furthermore, this is in no way
compatible with the normal behaviour of Fsfirst()/next(), so you'd have
to split up your code, anyway.

Ciao

Thomas

The example codes are at the end of this message. Please don't expect
superb code there, the programs work, that's all.

> In the compendium it says that you call Dpathconf() with name and mode.

> and I always got the same answer... 12 under MagiC!

Well, name actually means a pathname, either to a file or a directory.
Otherwise, it wouldn't make too much sense, would it? You wouldn't be
independent of the filesystem at all ...

Ciao

Thomas

/*
 * d_getcwd
 *
 * Just like Dgetcwd(), but uses Dgetpath()
 * automatically when Dgetcwd() isn't available
 * (of course, in this case you can only pray
 * that buf is large enough as len will be
 * ignored). Dgetpath() is also used if
 * Dgetcwd() returned EDRIVE. This is due to a
 * problem in connection with MetaDOS, which
 * does not offer Dgetcwd(), so that this call
 * is directly passed to the underlying GEMDOS
 * which of course does not know about this
 * drive at all.
 *
 * Input:
 * buf: Pointer to buffer to which the current
```

```
 *      path should be copied
 * drive: The drive for which the current path
 *        should be determined (0 = current,
 *        (1 = A, 2 = B, etc.)
 * len: Maximum number of characters which can
 *      be copied into buf
 *
 * Return:
 * Return value of Dgetcwd() or Dgetpath()
 */

Hi!

In article <34bdfafa3f11a0@xs4all.nl>,
    josdb@xs4all.nl (Jos den Bekker) writes:
> How can I redirect stderr on an ST? fileno(stderr) yields -1, and
> consequently Fforce() returns an error code. No problem with the other
> std files. Only this one.

Well, stderr is not really a standard file handle on the Atari. GEMDOS only offers stdout, stdin, stdaux (for the modem) and stdprn (for the printer). So most C-libaries "emulate" stderr by using stdaux as a replacement. For that, they first have to Fforce() handle 2 (stdaux) to -1 (BIOS con:) if isatty(2) is true (it may be false if another program has already redirected it to a file, e.g. a shell).

So, in your case either Fforce(2) hardcoded (best only if isatty(stderr) != 0), or use pipe() and dup2() to redirect output before calling exec().

Ciao

Thomas

Looks fine to me. The example there you have commented, is realy,
ehhh...
commented to the bones. Great stuff Thomas!

Yeah I know. I didn't realy think much when I tried it and I realised my
misstake. Realy stupied of me but the Compendium isn't exactly clear on
what to do.... :-)

Well, it is the example source I wrote for the article I've already
mentioned. And for articles (or published sourcecode) I prefer to comment
too much instead of too little.

Ciao

Thomas

Okey, but still it was a very comprehensive example with loads of
info.

Any more articles you have done which could be worth translating? The
source code was rather selfexplaining as well so there isn't much
need for more text.

Hi everybody, SORRY TO BUG YOU...

I am looking for any software about astrology...

If anybody know something about this kind of soft, for ST (native, no
PacifiST),
please mail me at cramailh@ensci.com...

Thankx a lot

ATARI IS THE BEST !

What's crappy about them? I use bitfields all the time... The instructions generated are pretty slow, but they do work.

Yes, Andreas is 100% correct. That's one of the (many) reasons I wrote the original version of NeoDesk back in '87 :-)

The best solution would have been to add a char* to the end of the
structure and keep a curtated form in d_fname[]. But then, MiNT was
intended to make TOS more UNIX compatible, not to improve it ;-)

I'm not quite sure what you mean by a disk image. Is this some sort of backup file? If so, you would need the file format.

If you could copy the entire file into RAM, there would be no problem. It would work just like a ramdisk.

If you could keep a map of disk image sectors to file sectors in RAM, there is still no problem. Just read in the appropriate file sectors to generate the data in RAM as needed. You don't even have to make re-entrant BIOS calls, since you already have the old Rwabs() vector stored in your TSR.

The big problem would be telling your TSR which file to use (and to generate the sector map), which could be done using a cookie / function pointer.

BTW, an extra argument was added to Rwabs() to handle more than 32K physical sectors. You MUST implement this in your own handler!

Why? When you call Fread etc then gemdos translates this into bios
Rwabs calls which end up going through hdv_rw - at which point your
code simulates an Rwabs but in fact accesses the FDC hardware
directly.

If, on the other hand you mean a different logical filesytem, then you
would need to hook into gemdos and not the "hdv" vectors.

Which one of the above is it?

>Save some system variables for instance?
>Or can I assume that most replacement filesystems (MetaDOS for instance)

>I really need this to work in normal TOS with any filesystem...

We need to be clear about the above first. ;-)

I keep meaning to transfer all my ST stuff onto the PC. The only
problem is they are all in extended disk formats which makes it a
pain. Maybe when I get NT to talk to STiK/STiNG ... ;-)

I see. As it happens I wrote a program to interrogate the MagiC header
for aes version info. I can email it if you like. It's a gem program
but if you want to do it yourself it would only take a few minutes to
knock up a tos version from magx.h

If there are mismatched versions then you are probably right.

>Anyway he will get new disks from the store and see if it fixes it.

Another reason for wanted english docs!

Well it's not me who are having the problems, it's a friend. Anyway, I
was about starting looking at how to get the version number from MagiC.
If you would like to mail it to me I wont stop you. :-)

Well the guy has now tested it with replacing MagXDesk with a version
from MagiC 4 and now all error codes are gone.

Yes and no. It does not access the FDC, it accesses a disk image of a
floppy disk instead. This means using the GEMDOS Fread and Fseek
routines on the disk image, which would not work from another GEMDOS
call becuase of the re-entrancy problem.

: If, on the other hand you mean a different logical filesytem, then you

No, I only want to replace the low level sector stuff,
although I want to be able to access disk images on any filesystem,
not just FAT.

: I'm not quite sure what you mean by a disk image. Is this some sort
: of backup file? If so, you would need the file format.

I mean just what is says. A floppy disk image, ie. an .ST, .MSA or .DSK
file.

: If you could copy the entire file into RAM, there would be no
: problem. It would work just like a ramdisk.

But would not work on my 1 MB ST. 1 MB minus 720kb of disk image
leaves about 300k to work with.

: If you could keep a map of disk image sectors to file sectors in
: RAM, there is still no problem. Just read in the appropriate file

: sectors to generate the data in RAM as needed. You don't even have
: to make re-entrant BIOS calls, since you already have the old
: Rwabs() vector stored in your TSR.

Correct, but this would only work on a FAT filesystem. (see earlier
postings)

: The big problem would be telling your TSR which file to use (and to
: generate the sector map), which could be done using a cookie /
: function pointer.

I have already taken care of the calling mechanism. It's the lowlevel
stuff that is generating problems...

: BTW, an extra argument was added to Rwabs() to handle more than 32K
: physical sectors. You MUST implement this in your own handler!

Hmmm... I have implemented the Rwabs() call as described in some old
hypertext doc I have on BIOS calls. Could you post the syntax of the
extended Rwabs() call so I can check if I implemented it?

Thanks,

Hi,

Well now when we have discussed long filenames and how to get
hold of them, now how do I make scrollable edit-fields in my dialogs?

I don't want to to expand all my dialogs to handle x long filenames.
The dialogs would be ridiculous big! So how can I make them autoscroll?
Does the AES handle if for me or do I have to use prog-defs? If so,
has anyone done it? Thomas? :-)

I know how to make a prog-def (I already use them for different things)
so that is no problem, but I'm not sure how to do my edit-fields scroll.
Any ideas?

Hi!

This is my first post to this group, so I don't know if I've got the right
place for this query, but: Does anyone know where I might be able to get a
copy of the GFA Basic 3 compiler? I recently exhumed my old STE from our
loft and brought it to Uni with me, but no longer have a copy of the
compiler.

Thanks in advance,

Jim Kinsey

Bringing Unix to TOS was the best thing that ever happened to Atari.
I simply cannot say the same about MagiC... especially since it lacks
compatibility with Unix. However, MiNT allows porting most Unix tools
fairly easily and was endorsed by Atari. MagiC programming docs have
not been translated to english, so I won't support it MagiC any soon.

Strangely, I was able to read most of the disks fine on my PC (win95 OSR2)
- although some had problems... for those I simply used Ghostlink (still not
had time to set up NFS + MiNTnet).

Anthony

I don't understand what you mean. Whatever I do, it doesn't work. (That
is, it doesn't work under normal TOS, but it does under MiNT.) File
handle of stderr is -1 and Fforce(-1,whatever) yields no result.
Fforce(fileno(stdaux),whatever) is successful, of course, but has
nothing to do with stderr. isatty() yields -1 for al std files.

True.

Btw, I seem to be having a problem with Dopendir() ...

```
main()
{
 Pdomain(1);
 printf("%d\n",Pdomain(-1));
}
```

... gives me zero!

What's MagiC playing at?

You do indeed need to hook into gemdos and have your own Fopen etc but
use Rwabs to read the disk. Your custom Fread will have the job of
converting the current part of the "image" so that the result of Fread
is the same as normal.

>: If you could keep a map of disk image sectors to file sectors in
>: RAM, there is still no problem. Just read in the appropriate file
>: sectors to generate the data in RAM as needed. You don't even have
>: to make re-entrant BIOS calls, since you already have the old
>: Rwabs() vector stored in your TSR.
>
>Correct, but this would only work on a FAT filesystem. (see earlier
>postings)

Rwabs should work on any filesystem. If your scheme means it won't
then you need to intercept the hdv vectors to provide the code to make
it work.

This is really two separate problems which is why it's taken me so long to get the idea! Try as I might I cannot think how to describe what's in my head so we'll have to make do with an example [oo!]

For argument's sake, lets say you want to access a floppy which has been formatted with 1K sectors. The FDC can do this but there is no code in tos to do so. Lets also say that the data on the floppy is a zip file.

Say also, that Fopen creates this FDB. We'll ignore the problem of generating a unique tos_handle to return to the caller!

```
typedef struct     {
LONG (*hdv_rwabs)(..);
LONG (*hdv_mediach)(..);
GETBPB    (*hdv_getbpb)(..);
void (*log_convert)(void *buf, LONG len)
/* more pointers ... */

WORD cur_seek;
WORD tos_handle;

/* other stuff */
}    MY_FDB;
```

When a program calls Fread, it will access MY_FDB and calculate the arguments to be passed to Rwabs. After Rwabs returns log_convert is called - this "unzips" the data so that the program only sees the correct expanded data. If log_convert is NULL then nothing happens.

Any of the hdv pointers in MY_FDB which are not NULL get hooked into the hdv vectors just prior to the Rwabs and the originals restored when Rwabs returns. hdv_rwabs gets the job of accessing the FDC to read the 1K sectored floppy. If hdv_rwabs is NULL then the normal Rwabs gets the job.

In reality the FDB would just have a pointer to where the hdv function pointers are stored rather than duplicating them in each FDB. I'm dreaming this up as I type so no flames from third parties please! ;-)

Like I said. As I see it, you have two distinct problems. There's the physical side which gets dealt with by hooking into the hdv vectors, or not if the media is readable by the installed filesystem. Above that, you have the logical side. It might be that the floppy uses Minix for instance rather than my horrible idea of a zipped file!

>: The big problem would be telling your TSR which file to use (and to
>: generate the sector map), which could be done using a cookie /
>: function pointer.
>
>I have already taken care of the calling mechanism. It's the lowlevel
>stuff that is generating problems...

>
>: BTW, an extra argument was added to Rwabs() to handle more than 32K
>: physical sectors. You MUST implement this in your own handler!
>
>Hmmm... I have implemented the Rwabs() call as described in some old
>hypertext doc I have on BIOS calls. Could you post the syntax of the
>extended Rwabs() call so I can check if I implemented it?

```
LONG Rwabs(mode,buf,count,recno,dev,lrecno)
WORD mode;
VOIDP    buf;
WORD count,
     recno,
     dev;
LONG lrecno;
```

Use recno unless it is set to -1 in which case lrecno should be used.
Rwabs may invoke etv_critic btw.

It's the not forthcoming english docs that did it for me. I refuse to
cough up nearly £200 for MagiCPC without them. :-(

It's too late now anyway - I've spent it on C++ Builder.

Yep, I was confusing it with the ability of Frename() to rename folders as
well, which was not possible prior to TOS 1.04. Sorry.

Ciao

Thomas

Hi,

I would like to program in C on my Falcon, but all I have is the latest
version of Turbo C. This means I can not debug in color, the compiler
is not very fast (no cache mechanism for include files), it's al lot of
trouble to compile the mintlib-files, ACSpro is no longer supported, etc.

Can someone give me an hint on how to get a copy of the Pure C compiler,
since that would solve all these problems. I have contacted ASH but they don't
sell it anymore!

> generated are pretty slow, but they do work.

Crappy is for instance that

```
typedef struct {
   unsigned field1 : 3;
   unsigned field2 : 5;
   unsigned filed3 : 8;
 } EXAMPLE1;
```

compiles to sizeof(EXAMPLE1) == 3, while

```
typedef struct {
   unsigned field1 : 4;
   unsigned field2 : 4;
   unsigned filed3 : 8;
 } EXAMPLE2;
```

compiles to sizeof(EXAMPLE2) == 2. Basically it is not predictable where Pure C compiles an assembly of bit arrays to the correct size, or to a larger one.

This of course does not matter as long as the bit array is purely internal to your code. But if you gotta match some API, or some hardware register this way, you're lost. Basically I wanted to use EXAMPLE1 when writing the STinG Ethernet driver for LANCE based hardware. There was no way to access the LANCE registers using bit fields in Pure C, instead I had to revert to AND and OR operations with masks, which was painful ...

Another quirk one better knows, is that Pure C handles bit arrays always using 16 bit accesses. This can be fatal : Imagine some buffer with a few bytes, and you got to interpret one of them as a bit array. So, for instance you define the array

```
typedef struct {
   unsigned flag1 : 1;
   unsigned flag2 : 2;
   unsigned flag3 : 3;
   unsigned flag4 : 4;
   unsigned flag5 : 5;
 } ARRAY;

ARRAY *array;
```

Now accessing the flags via array->flag2 works only if the byte that is to be interpreted as a bit array happens to be at an even address. Otherwise the code gives three bombs (on a 68000). Some masochistic people may consider it fun to find such bugs. I don't.

These things lead me to the statement that Pure C's bit array handling is crap, and hardly usable.

Cheers Peter

In, I believe, the CLA digital designer version 3 from Data Uncertain software (Craig Graham) I recall noticing a reference to a GEM development system for the Arizona Microchip PIC microcontrollers. I believe the publisher of the software was Custard Slice Software.

Does anyone know about this? Or alternatively, has anyone else put together a development system for the PIC to run under TOS (not necessarily GEM)?

I would appreciate a reply by email if possible. I can't find the time now to look regularly at the usenet.

Thanks for your help.

It does! Mine has a tick-box for v3.5E. Look for the PD archive
MNLU_TRQ.LZh (or ZIP).

Hi, all. Thanks for all the replies on my question about inverted text output with VDI :) I ended up with maintaining two handles, one for normal display and one for inverted display. I figured this was the most flexible way of doing it. Ok, now I have a new problem, caused by my lack of German knowlegde. How to pass paramteres to the xFSL or UFSL interface!! I use ASM for my developments, read C sources very badly and so didn't understand anything from the German docs about the interface. That is, I understand how the structures passed look, but how exactly are they passed? Do you pass the pointer to the structures on the stack? Do you stuff the structure itself on the stack? HOW?? Please don't tell me "Use

C" cause I've heard that so many times and it get's tiresome :))

So, what I need to know is how to pass the structures via those interfaces, not how the structures look, as this is pretty clear.

Thanks in advance, take care..

>
> But it is though!

OK, that's right. But it's still necessary to distinguish between TOS and MiNT-domain to read the filenames. And I'd rather prefer to use Dopendir() & Co. then, as using these does not make it necessary to check the domain, but only if they're available.

And, as said before, using a proper library which offers dopendir() (note the lowercase letter, i.e. it's a library provided function) is the best way to procede, anyway.

```
> main()
> {
>  Pdomain(1);
>  printf("%d\n",Pdomain(-1));
> }
>
> ... gives me zero!
```

Strange. Does your compiler use 16-bit ints? In that case, you should check your Pdomain()'s return type, which should be long. If so, use %ld instead (or cast Pdomain() to int) and you should get the correct result.

Ciao

Thomas

> is, it doesn't work under normal TOS, but it does under MiNT.) File
> handle of stderr is -1 and Fforce(-1,whatever) yields no result.

Of course. As said before, GEMDOS knows no stderr, so the programs have to simulate it. This is done by "abusing" stdaux (GEMDOS standard handle 2) for stderr (ATARI /did/ approve that, as the serial lines should always be accessed via the BIOS, anyway).

So, if a program is run the startup code will test whether stdaux is connected to a file (i.e. the simulated stderr has already been redirected, e.g. by a shell). If not, it has to make sure that anything written to GEMDOS handle 2 will appear on the console. This is done by Fforce(2, -1), and that's why fileno(stderr) returns -1.

Fforce(-1, something) can't work, as the first handle has to be a standard handle, i.e. 0 <= handle < 6. That's why you should either redirect GEMDOS

handle 2 directly (if it's not already connected to a file, which can be checked via isatty()), or use dup2(). It's not a good idea anyway to mix library calls (i.e. fileno()) and direct GEMDOS calls it not absolutely necessary.

Perhaps you should look at the following example (should work with the MiNT-lib):

```
-- cut here --
#include <stdio.h>
#include <unistd.h>

int main(void)
{
     int      dupfd;
     FILE *handle;

     if (isatty(fileno(stderr)))
     {
          if ((handle = fopen("stderr", "w")) == NULL)
          {
               perror("redirect");
               return(1);
          }
          if ((dupfd = dup2(fileno(handle), STDERR_FILENO)) == -1)
          {
               perror("redirect");
               return(1);
          }
     }
     fprintf(stderr, "This is sent to stderr ...\n");
     return(0);
}
-- cut here again --
```

> Fforce(fileno(stdaux),whatever) is successful, of course, but has
> nothing to do with stderr. isatty() yields -1 for al std files.

That's why you shouldn't mix GEMDOS and library calls. Use dup2() instead and it should work. Or you'll have to live with the fact that GEMDOS handle 2 ("stdaux") is "abused" for stderr in all startup codes, as GEMDOS does not provide a standard error handle.

If you take a look at unistd.h of the MiNT-lib, you'll see that STDERR_FILENO is 2, i.e. GEMDOS' stdaux.

Ciao

This would be a solution, but would still require different code for TOS-
and MiNT-domain and would also require new header files or some "wrapper"
source.

> But then, MiNT was
> intended to make TOS more UNIX compatible, not to improve it ;-)

Well, then please tell me what's worse in MiNT? Of course, the IPC
possibilities of plain TOS are a lot better, as well as TOS' support for
different file systems and its preemptive multitasking ;)

Ciao

Please can anyone help me with some problems I am having setting up GNU GCC C++ on the Atari ST:

(I have asked Jwahar Bammi himself but he no longer has an Atari and was unable to help.)

I have successfully setup the 2.1 distribution of gcc that I obtained from the FaST Club (UK) and subsequently updated the executables with those from the 2.3 and 2.5.8 releases.

Using this setup I have compiled some fairly simple c++ code but on trying more substantial source I have been confronted with loads of warnings and errors which have looked like they originate from the include files and libraries. I am still using the libraries and includes I got with the 2.1 distribution (includes = patchlevel=7). The source code I have tried is definitely error-free because I have successfully compiled it on GNU GCC on my college's Unix system.

I have obtained more recent libraries and includes from the Atari Gnu directory at FTP UMICH..... These comprise of the following files:

GPINC20.ZOO
GPLIBO20.ZOO
GPLIBS20.ZOO

When expanded the source code archive has a patchlevel=20 file in it. How do I make these newer up dated libraries with my system? The addition of makefiles etc in these archives make me assume I have to do something with 'make' to update the g++ library but I really don't understand how to do this. Can anyone help me??

The following also concern me:

1. Has anyone ever managed to set up a complete Atari GNU GCC C++ system using all the most updated components. Subsequently, have they been able to compile any really substantial code using it.

2. After trawling through old newsgroup stuff I have found mention of newer versions of the compiler than 2.5.8. Do these exist and if so

what do they need to run? (ie Mint or Falcon/TT). Are they more stable/better versions?

3. Has anyone used the Software Developer's Kit update 1997 version of GNC C++, is it any good? What libraries does it use?

4. Again looking at newsgroup articles, it appears Atari gcc g++ has been steadily disappearing from subject lines. Is anyone still using this software? Is there anyone who has battled with the infuriating TEX docs and put together a usable 'modern' system with updated libraries etc. Is it all worth it or should I jump ship to Borland C++ or the Unix GCC now whilst there's still time before my college project deadline?

I am sorry this posting is so long but I have got SO FRUSTRATED trying to set this monster up - it has been very lonely. Surely there is someone somewhere who has the knowhow. Please help me out.

Thanks

Ross

Can't you configure your Netscape properly so that it only posts true ASCII versions of your messages. Getting each message twice (in HTML) is stupid and annoying.

Cheers Peter

Dear Programmer,

If you live in Orange County California and want to be a part of a

Shareware development group writing technologically advanced software,
I am looking for you.

The current project being worked on is an Atari 8-bit Emulator for Win32.

Member requirements:

1. Enjoy learning.
2. Be willing to work on your own, with a once a week group meeting.
3. At least 6 hours a week coding time for the project.
4. Know C/C++ (We are not teaching basic coding!)
5. Familiar with Win32 programming. (Not a must).
6. Have own equipment to work on.

Groups can not be larger than 5 or 6 for a given project, thus I can not
accept all applicants.

If you are interested, please contact me at atrouw@etree.com or
atrouw@home.com for more info.

Arie Trouw

The big *IF*
Well, if I do have any success, I'll let you know.

> So you want to stop the user from killing your password program? :-)
It kind of makes my app pointless at the moment, but never mind, it was
good programming practice. :-) My first GEM programme!

Yes.

>In that case, you should

Hmm. Is the Compendium wrong? It says

WORD Pdomain(WORD)

Thus I added

#define Pdomain(a) (int)gemdos(281,a)

to the relevant header. Changing it to

#define Pdomain(a) gemdos(281,a)

and using %ld still returns zero (gemdos() returns long). I also tried
Pdomain(-1L) just in case. Is the compendium wrong about the gemdos
call number 281? I hope so otherwise I'm facing a really tricky
problem.

I'm interested in this also. I did attempt it once when I was only 3/4
familiar with Gem and gave up after getting bogged down with all sorts
of problems (some related to this, mostly to do with something else).

>I don't want to to expand all my dialogs to handle x long filenames.
>The dialogs would be ridiculous big! So how can I make them autoscroll?
>Does the AES handle if for me or do I have to use prog-defs? If so,

The aes does nothing to help. Unless someone knows better I think
you'll be writing your own objc_edit. :-(

>I know how to make a prog-def (I already use them for different things)
>so that is no problem, but I'm not sure how to do my edit-fields scroll.
>Any ideas?

On the assumption you'll have your dialog in a window then perhaps use
a standard editable text field as a "window" through which you view
your larger field. You could at least use the MU_KEYBD event to see if
the field wants scrolling, and which way?

This is probably referring to the ability of the browser of doing shttp
(secure http). I've been told both authors of the CAB.OVLs for both
STiK/STinG and MiNTnet work on corresponding extensions.

Cheers Peter

There already is such a browser (sort of). CAB-for-MiNTnet.ovl has support
for SSL (secure) connections, however as the author is in the US he is
not able to distribute this version of the package due to stupid American

export laws.

Someone outside of the US could compile the SSL libraries, and then a capable browser could be provided (under MiNTnet).

As for under Stik/Sting, contact the CAB.OVL authors for support.... and for I-Connect, pester ASH.

Anthony

Can some MiNT guru tell me why MiNT needs about 700k of free RAM to
do a fork? It doesn't matter how big the program being launched,
I always get a "fork: out of memory" error when I have less than
700k of free memory left. Very annoying...
Thanks,

I added an element to the G_COOKIE structure in Geneva for this very
reason. None of the other methods are adequate.

I don't think so which is unfortunate, simply because of the fact
there is no documented call to "lock the desktop" which would be
required for a appl_get_top_app() call to have any relevence. This is
assuming a "top" application can be defined at all!

Hello,
i would like launch GEM application in singleTOS with shel_write()
but, the atari compendium has some errors about shel_write() and
when i use shel_write() (in single mode without the 100 value in
isgr parameter) the application is launched when the process father is

finished. So what is the right way to use shel_write()?

Thanks for yours answers and apologize for my bad english.

Hi!

In article <rw5iuspqyyw.fsf@ozone.inria.fr>,
    Dominique Bereziat <bereziat@ozone.inria.fr> writes:
> So what is the right way to use shel_write()?
Single-AES and MagiC both require the calling program to exit in order to launch the new one. That is, the correct way to use shel_write() (mainly useful for SingleTOS) is

```
shel_write();
appl_exit();
Pterm0();
```

If you want to launch a program so that the caller freezes until the child has finished, you'll have to use Pexec() instead, which has some drawbacks when used for GEM applications.

If you want to run programs in parallel, you'll have to use MagiC's "100"-parameter. This will work with both MagiC and MultiTOS/N.AES/Geneva, as the latter always spawn children in parallel.

Ciao

Thomas

Newsgroups: comp.sys.atari.programmer

I've written a high speed serial driver which implements asynchronous block I/O. (At least I've got it working on Serial 2 of my TT so far.) I was wondering if anyone would like to suggest any improvements in the data structure pointed to by the cookie before I start on the other platforms:

```
struct ser_cookie {
 long bps[16]; /* list of baud rates */

 short id; /* driver identifier */
 short ver; /* version number */

 void cdecl (*write)(struct ser_block*); /* block write */
 void cdecl (*read)(struct ser_block*); /* block read */
 void (*flush)(void); /* flush all queued I/O */

 void (*error)(void); /* user supplied read error handler */
 void (*dcd)(void); /* user supplied loss of DCD handler */
 void (*break)(void); /* user supplied break handler */
 };

struct ser_block {
 void *pbuf; /* data buffer */
 short size; /* number of bytes to process */
 void cdecl (*done)(struct ser_block*); /* user supplied handler */

 short volatile status; /* 0=busy, -1=done, 1=quick, 2=flush */
 short index; /* reserved */
 void *next; /* reserved */
 };
```

The driver supplied functions MUST be called in super mode. All

registers, including the status register, will be preserved. If status==1 (quick) on return, it means that the operation was completed before returning and the (*done)() function will NOT be called.

All of the user supplied handlers are called in super mode but with interupts enabled. All registers are saved prior to calling. A NULL pointer can be used to disable any handler.

One can queue many (*block_write)() requests (using a different ser_block structure for each call), and intermix with BIOS write calls, and all of the bytes will be sent in the correct order.

One can queue (*block_read)() requests too, but BIOS read will wait until ALL queued block read requests are handled. OTOH, if there are any bytes in the IOREC buffer when (*block_read)() is called, they will be copied into the block buffer.

The (*flush)() function will call all of the queued (*done)() handlers with status==2, in order to conveniently handle any dynamic RAM allocation.

Note: It is possible to call the block I/O functions from within a (*done)() handler. To prevent recursion, one should turn off interupts first.

Well I would define the top application as the one with the tick by it in
the Desk menu. I guess this would be the app that's currently receiving
keyboard presses.

Let us assume appl_get_top_app() exists and returns the i.d. of the
top process ...

>What do you mean by

>"lock the desktop" anyway?

Keeping the component parts which define a "top" application in a consistent state so that the information returned by appl_get_top_app() can be made use of. Otherwise, all we can say is that some process was the top app at the time of our call but might now have changed - we cannot tell, therefore the result we obtained is useless.

>: assuming a "top" application can be defined at all!
>
>Well I would define the top application as the one with the tick by it in
>the Desk menu.

The problem is defining which application gets the tick. It has to be consistent across all Gem operating systems.

>I guess this would be the app that's currently receiving
>keyboard presses.

If forced to make a definition I'd have to agree. The reality of the situation however, is there is no such thing as a top application. It is a concept invented by us and of no importance to Gem.

This "program chaining" is the only mode available to a singletos
shel_write() call. Your only other solution is to use Pexec().

Hello,

I have only recently learned that the Atari system character set can
vary greatly in different countries. From the beginning, for instance,
there has been a Polish Atari with Polish characters in place of the
Hebrew ones in the UK and, I suppose, the American machines.

Does anyone know how many different system charsets there are and
which characters they contain? Or where I can get this information?

Thanks in advance.

Seems strange but I can't make any cli understand reading a file instead of
stdin to redirect arguments.

ls | expandar
mkdep < list

The argument coming to the program is always empy, with okami, CMD or mupfel
CLI, where am I wrong ? Doing:

dir | more

does work well, so what ? I am programming in C but this should not be the
problem, the environment is magic+thing.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

I'm in search of the best way of making a network in the game i'm
making...
i'm thinking of midi or lan... did someone has any info on how to
program those ports? the fastest way of course:)

thanks
please reply by mail...

What is wrong with HSMODEM that you've built your own ?

Dunno about John's reason, but unpublished sources and an uncooperative author that never even replies to e-mails is a good enough reason to me.

For instance, Harun suggests if someone ever wants to write proper drivers for MiNT that use the HS-Modem functions, to contact him. Several people have, but we still don't have XDD versions of HSM, because Harun apparently doesn't agree with the programming ideas of those who contacted him...

I realize not everyone likes the idea of sharing their sources, but since I got into MiNT and the whole Linux / GPL world, It's become typical for me to recompile things to my own tastes. GPL also allows people to further improve someone else's work.

Before HS-Modem, there was Franz Sirl's Fast_Serial, which could detect and adapt to various SCC substitutes and PCLK frequencies. While it wasn't perfect, I'm sure there are people who could have further improved Franz' work, if the sources ahd been published. But now, Franz has apparently left the Atari scene and vanished without a trace and his sources long gone.... :-/

An errata file is found at my web site in signature below.
The relevant bit you want is:

6.138 (shel_write() - table)
shel_write() mode 1 should have a wisgr paramater of 0 to launch a TOS
application or a wisgr parameter of 1 to launch a GEM application.

If not multitasking use Pexec().
If multitasking use shel_write().

Something like:

```
#define SHW_CHAIN       1           /* Normal shel_write mode */
#define SHW_PARALLEL    100         /* MagiC parallel shel_write mode */
```

```
int LaunchProgram()
{
    int ret;

    if (!multitasking)
    {
        if (window == OPEN)
            CloseWindow(whandle, TEMP);
        Disablemenu(); /* except Desk menu for accessories */

        pexec_return = Pexec(0, program_path, string, NULL);
        ret = (pexec_return < 0) ? FALSE : TRUE;

        Enablemenu();
OpenWindow(whandle);
    }

    if (multitasking)
    {
        if (magic)
            ret = shel_write(1, 1, SHW_PARALLEL, program_path, string);
        else
            ret = shel_write(1, 1, SHW_CHAIN, program_path, string);
        ret = (ret > 0) ? TRUE : FALSE;     /* ap_id of program returned */
        if (geneva_cookie && (ret == -1))   /* program loaded in single- */
            ret = TRUE;                     /* tasking mode return -1 */
    }
    return ret;
}
```

I do not really know, but I suppose there is one for each language you
could get the machines in. IIRC the language identifier is 4 bits in a
number contained in the SYSBASE structure, a pointer to which can be
found in the system variables. So this corresponds to sixteen languages
in which the machines were available.

You should note however even with older versions of NVDI you can install
any other font as the system font. Considering this, there is an almost
infinite number of different system charecter sets.

Cheers Peter

Ys, but my point was: has Atari delivered machines with that many
different system character sets? And if they have, what were the
languages and what were the specific codes/characters?

>You should note however even with older versions of NVDI you can install
>any other font as the system font. Considering this, there is an almost
>infinite number of different system charecter sets.

Oh, yes, I know. And even before NVDI existes there were programs that
allowed you to change the system font to your heart's desire. But
those are individual customizations.

Anyway, I was hoping Atari had systemized its character sets roughly
along the lines of the iso-8859-x sets, but this is most probably not
the case. The national variations for languages with Latin based
alphabets were probably only in the range of what in "normal" Ataris
are the Hebrew characters, making it impossible to write conversion
routines for all the languages in one iso-8859-x group.

I was particularly wondering: are there Ataris with Cyrillic and
Arabic characters sets?

Thanks for your reaction.

At _sysbase+$1C and is diagnosed by programs such as Profile, Sysinfo.

>You should note however even with older versions of NVDI you can install

I'm not sure how relevant this will be to Jos but the system char set
can be changed by programs such as Tastset and Key_Edit.

Also .... when Magic is installed it will copy the CURRENT character
set into MAGIC.RAM so that this set will be used whenever Magic is
run.

I⍰m currently writing a program that aims to
devolop your ability to hear and define intervals.

Since the only programming tool I have is GFA-basic, and thats
also the only language I know how to use, that⍰s the one I work with.

Now to my question(s):

-Where can I find some _good_ documentation on how to use
GEM/AES from GFA-Basic..?

-How do I get Flying Dialogs 4.9 to work? (Nukes me every time!)

-Are there still people using GFA..?

/Joakim

Hi everyone,

I'm trying to do a pretty basic screen scroll in GFA but It don't want to work the way I want it to. First I write to the physical screen XBIOS(3) and then I activate the logical screen XBIOS(2). I then write to the logical screen. What I want to accomplish is to have the logical screen (graphics) replace the physical screen graphics. But I want to have the logical screen look like it is falling from the top of the screen and bump the physical off the page e.g logic scrolls down and phycal screen scrolls down evently all the way off screen. I've got some old BMOVE routines but they only make use of scrolling one screen. Anyone one got anything kicking around.

Thank's
Scott.

rich@demon.nl
> I want to experiment with computer generated compositions, but i
> don't know how to control the MIDI-ports...

The easiest way is to get a copy of HSMODEM6. You can then access the midi-ports as if they were files, eg:

```
    FILE    *midi;

    midi = fopen( "U:\\DEV\\MIDI" );
```

You can then use the whole standard C library for the midi-ports exactly as you would for a file.

The next easiest is to use the BIOS functions, Bconout(), Bconstat(), Bcostat() and Bconin().

A simple example program to send some data to the midi-port:

```
#include <dos.h>

int     main( void)
{
    char    data[9] = {1,2,3,4,5,6,7,8,9};

    int     idx = 0;

    while( idx < 9 )
    {
        /* wait until MIDI port is ready to recieve, you sould
           probably include some time out code here too */

        while( !Bcostat( 3) );

        /* send data to the MIDI port */

        Bconout( 3, data[idx++] );
```

```
    }

    return( 0);
}
```

When reading data replace Bcostat with Bconstat and Bconout with Bconin.

The most difficult but most efficient way is to access the MIDI controller directly. This can be done in C but is best done in assembly. I'll not go into details here as either of the above should be sufficient for most purposes.

Jr,

Yes, that's right. If you make sure the char. set is OK (using the
AUTO produced by key_edit, for instance) when you install Magic you
will get that char set installed whenever Magic is loaded. No need to
use the key-edit AUTO again.

Probably your best bet is too start with GFA Fly4.9 until you're a bit more confident about what you're doing. Good sources of GEM doc documentation specifically related to GFA are dificult too find, but use something like the Atari Compendium should get you started. Also check out the GFA FAQ:

http://www.geocities.com/Athens/5272/gfafaq.htm

> -How do I get Flying Dialogs 4.9 to work? (Nukes me every time!)

Start with the example program and begin finding out how it works, then move on from there. (Mail me privately if you need some help)

> -Are there still people using GFA..?

Yes!!

: CLI, where am I wrong ?
Well, what do you expect? It sounds to me that you expect argc being > 1
in that case, but that won't happen. IO-redirection does just that: it
redirects stdin, stdout or stderr to a file or pipe. It does not influence
a program's arguments in any way, i.e. the "< list" will not be passed to
mkdep in the above example, but evaluated by the CLI.

If you need to know whether stdin/stdout/stderr are no longer connected
to the terminal, use isatty(), which will report 1 if the requested stream
is associated with a TTY (Terminal TYpewriter) or 0 in the case of
redirection to a file/pipe.

Ciao

Thomas

Greetings all,

I'm interested in having the programme that I'm developing obtain its path and variable settings from a file, but to have this file human readable so it can be adjusted by the user to suit his or her requirements.

An example:

This is an extract from the configuration file qed.cfg (from the text editor qed v4.0)

```
GdosFontID=0
GdosFontSize=10
GdosMode=FALSE
GemdosDensity=0
GemdosDriver=""
GemdosNLQ=FALSE
GemdosPageHeight=65
GemdosPageWidth=80
GlobalAutosaveCfg=FALSE
GlobalBinLineLen=80
GlobalBlinkCursor=TRUE
GlobalGEMClip=TRUE
GlobalOverwrite=FALSE
GlobalTransSize=100
GlobalWindCycle=TRUE
HelpProgram="C:\ST-GUIDE.APP"
LocalBegin="*"
LocalBackup=FALSE
LocalBackupExt="BAK"
LocalInsert=TRUE
LocalKurzel="D:\EDITOR\QED-400\TAGS\STG.KRZ"
LocalTab=TRUE
```

or one like what ST-GUIDE uses...

```
# Default search path, where ST-Guide looks for 'HYP' hypertexts:
PATHS=C:\GUIDES;A:\GUIDES
#
# HCP is used to compile STG files into HYP files. STool uses this
# entry to find HCP and compile:
HCP=C:\ST-GUIDE\HCP.TTP
#
# Hypfind is called by ST-Guide to search for search masks in all
# pages in the current hypertext.
HYPFIND=C:\ST-GUIDE\HYPFIND.TTP
#
```

Where the hash '#' symbol denotes a comment line.

I'm using a C compiler (Lattice 5.6) Should I be using switch statements, structures, if else or global variables?? I'm a bit stuck for an elegant way of doing this.
If someone could shed some light on this, by way of pointing me to an appropriate web site, or recommending a suitable book or similar, I'd be most grateful!

Thanks,

Hi! I've done basic I/O routs via // port! they're usable via a TRAP as
the bios functions.
they include byte/memory block send and receive, multi user links, and a
few other stuffs

My main concern is that i'll need some help for making examples (I'm a 68k maniac, and
I'm not very hot to write a networking programm in C right now!)

If you're interested, Email me, I'll send you the routs and the documentation!

thanks!

I get the impression that you want the output of one command to appear in the command line of another command. This is done with back-quotes, ie the character '`'. Not all shells support them. Gulam, which I use on my atari, doesn't. I dial in to a UNIX system which does allow them, though.

If you put back-quotes around part of the command line, the shell runs the quoted part, saves what it send to stdout, then runs the command with the quoted bit replaced by the output of running the first command. I guess it's easiest to explain by example.

If you type
cat `echo foo.txt`
the part "`echo foo.txt`" will be replaced by "foo.txt". The command line passed to cat will be "foo.txt", so it will print the contents of the file foo.txt on stdout.

If you do
cat `echo foo.txt` <bar.txt
the result will be the same, because cat does not read it's stdin when it has a command line to tell it what file to use. i.e. The command line cat see's is "foo.txt".

These examples are, of course, trivial. On the other hand, it is very usefull if you have a file which is a list of files, and you want to display all of them, one after another. For example, list.txt is a list of C source files for your program, like this
header.h main.c getline.c sort.c output.c

to display all these files (assuming they are in the same directory as list.txt), you can

cat `cat list.txt`

the "first" cat (not inside the back-quotes) gets "header.h main.c getline.c sort.c output.c" on its command line, so it lists all the files.

assuming "edit" is the editor you normally use,
edit `grep -l typo *.txt`
will run edit on all the files that contain "typo". (grep -l lists files which have matches in them, but does not actually print the matching lines)

Hope this info helps,

I could write a MiNT specific serial driver, but MiNT does not support asynchronous I/O, nor do I use (or ever intend to use) MiNT, so it is of no interest to me personally.

(Frankly, it wasn't that difficult. The biggest stumbling block was due to a documentation/implementation error in the TT.)

My next project is to write my own PPP and TCP/IP interface which will use my serial driver.

I HAVE to strongly discourage you from undertaking such a project.

We already have WAY too many TCP/IP stacks on Atari; making yet an
other one would only further divide and confuse users.

STiK/STiNG and MiNTnet were already enough.
ASH's PPP-Connect was NOT a welcome addition.

Unless your driver will be totally BSD compatible (ie: allows porting
Linux and BSD stuff by simply changing the bindings like on MiNTnet),
your new stack will NOT be welcome either.

ASH should have standardized on a MiNTnet clone optimized for MagiC;
so should you if you really want a pick at the TCP/IP scene on Atari.

My opinion anyways.

Hi,

I haven't written a program that does this, but I would do it with global variables. I think it could be elegant if you treat them as symbolic constants, i.e. pretend you had
#define MaxWidth 20

As long as you aren't using globals to pass values into and out of functions you should be fine. The first thing your prog does should probably be reading the CFG file, so the rest of the program can assume that the variables are predefined and never change (of course, it should be the case that the values are predefined and unchangeable). This means that you might find it difficult to let the user configure the prog with menu choices, but I imagine it could be done.

Good luck and merry Christmas

And me. It's still my prefered choice of language, even though I 'dabble'
with both assembler and 'C'.

Isn't division and confusion what the free market is all about?
Having choices implies having to make choices.

Actually, I don't want to get involved in TCP/IP at all, but I can't
expect someone else to get all excited about asynchronous I/O
(especially if they come from a UNIX background).

I downloaded a "Space War" type game and the programmer talked about how he used
his own sprite routines instead of the TOS ones.So does what are the capabilities
of ST sprites and why would you use a TOS sub-routine to access them.Does TOS
emulate sprites?
Are they like the Atari's Player/Missile graphics (which aren't technicaly
sprites) or like Commodore's MOBs?

CyberSTrider is on the lookout for a programmer with Lattice C and Devpac skills. We are currently looking at a project which will probably take a month to materialise and 2 months to fully bring to market.

There is an urgent need for a programmer so do get in touch if you think you may be able to help.

More details about the project and renumeration from CyberSTrider, via email...

Hey ye all,

I know this is not the place to post this but I always post to this new group with GFA questions and find someone has the answer every time. Jeez atarians must be the samrtest people in the world :)

Anyhow I've just been given an old relic, an Hewlett Packard 286,

Go ahead laugh but it was free and I don't have any other DOS operating system machines, all atari's. So on with the question.

I don't have a mouse for it but I've dozens of atari mice kicking araound. How come it won't work with the 286. Does anyone know how to re-wire the mouse to woek the 286?

Thank's
Scott.

I'll have a go at remembering the version numbers of the various TOS versions I've used/interfaced with.

(I had a copy of the info in a _very_ old Toolbox I hacked/wrote [1992-ish] - so I could compare and then flag "unknown" TOS/hardware - but this list is now corrupted and source is unavailable (corrupted also).

```
>  > >
>  > >   TOS   Date       GEMDOS  AES
>  > >  -------------------------------------
>  >     0.99       -1985
```

I used to have a copy of Disc TOS (1.00), but have lost it. I faintly recall GEMDOS 0.13 and AES 1.0 - but don't quote me.

```
>  > >   1.00  06-02-1986
```

```
         1.00  11-20-1985  0.13  1.xx   ROM   (November 20th, 1985)
```

Can't recall the AES version for the UK TOS 1.0 ROMs - it's probably 1.10 or something similar)

```
>  > >   1.02  04-22-1987

         1.02  04-22-1987  0.13  1.20   ROM   (April 22nd, 1987)
         1.04  08-08-1988  0.15  1.30   Disc  (August 8th, 1988)
```

(I'm not too sure about the [developer-only?] release of TOS 1.04 on disc - it's been a good few years since I last used it)

```

MagiC 5 .11 = TOS 3.00 / DOS 0.19 / AES 3.99 / Date 11.02.97

This is may not be what you asked for, but it is interesting that MagiC has not newer versions of TOS/DOS/AES (These version numbers has not changed since MagiC 3,0 IIRC)

Hey everyone,

Anyone got any code on how to aplphabetical sort strings in GFA BASIC. I can do it with the QSORT command but I'm loading the strings from a file and need to remember where they were located in the file. I need to do it through some sort of looping testing for the string with the smallest ascII number. When that number is found then remember what record # it was

located in and then continue compareing. Once all the strings have been compared, then I should have some sort of array hold the order in which the records should be sorted. Then all I have to do is call the records in the order of the sorted array and resave em.

Jeez this sounds easy enough but I can't seem to get the order of records to remain in an array proper.

Any Ideas?

... because DOS wants RS232-type signals through the serial port.
There are ways to get a serial PC mouse onto the Atari but I don't
think anyone has ever had the converse requirement before :-)

Honestly, though, your best bet is to go and plead with your friendy
local PC repairer/upgrader. He probably takes in a lot of old kit
which he would normally bin.

Well unless something has changed since Magic 5.03 then the Tos version
for it depends on the machine you are running on. On a Falcon Magic
always returns a Tos version of 4.00, I assume the 3.00 is what is
returned on an ST/TT.

A part of the old ST TOS (was it?) called line-A used to have some
routines for simple sprites. These are software sprites though, not
hardware ones like on the C64 or Amiga. The line-A routines are probably
quite fast on a plain old ST, but newer machines (Falcon, TT, Atari clones)
don't support them any more, so using them is no longer reccomended.
You should use either the VDI blitting routines or write your own using
the hardware blitter (STE, TT, Falcon) or software routines
(you'd have to write one seperately for each video mode).
Actually, writing a blitting routine isn't very hard when you know
68k assembly, should take just a few lines of code...

The disk-format shouldn't be a problem, Atari uses PC-formatted disks.
You'd have to run an emulator with Signum to convert the text files
to ASCII though, or use a converter (does one exist?) or find someone
with an ST and Signum II (ahem, that migh actually be me...) to convert the
files for you.

It would be nice if there was a system level Sprite "maybe Programmable Animated PNG". This way the programmer can create a desktop clock (perhaps like the corner clocks on television in the morning). The clock would grab the immediate and five day weather information for the location that the user is connecting from and the time information off the internet, then it would draw a small sun, or moon and its appearance would change as the time changes, depending on the time of sun rise sun set. It would utilize that 5 day forecast to know which png files to display. There would be different ones depending upon whether it was going to snow, rain, etc. It could possibly also have alarm capability loading in a multimedia file (wav, picture, animation or etc.) to alert or remind you. It can even have a min/hour based auto shutdown. You indicate to it that you only want to be on the computer for 1hr 15 min. remind me of autoshutdown 20 minutes before shutdown dialogue appears. After reminding you that shutdown in 20 min. and you click on OK, or 5 sec. pass and the dialogue box closes. The program takes over and closes all files (perhaps copying the memory and current program status information to a compressed file on the harddrive for rapid resume on next bootup), disconnects from all connects and properly prepares computer for being turned off.

The sprites can also be used for animated buttons, Animated media players, like a dancing CD player. You can have little objects come out and give you reminder messages. Take the sticky notes to the next level. You can even add audio sample support so that general midi instruments sounds can be used to notify you via SAM. You can record you voice to a reminder object and when it appears. it can write "Incoming Reminder. I would just like to see a computer that was more alive (so to speak).

From: strads@tmisnet.com (George Crissman)
Subject: Help -- Lattice C 5.6 Error 21: Illegal use of aggregate
Date: 1997/12/08
Message-ID: <348c36ce.6704503@news.tmisnet.com>#1/1
X-Deja-AN: 296345488
Distribution: world
Organization: MaximumAccess Internet Services
Newsgroups: comp.sys.atari.programmer

My ambitious little database program has grown to 44K after
compiling, causing Lattice C to complain about the placement
of relocatable data more than 32K away from the statement
using the data.

So I've decided to use the 'make' feature (instead of just
#including all the source files together). The big problem:
this code fragment that used to compile perfectly now
causes Error 21: Illegal Use of Aggregate. Adding insult
to injury, it also complains about an 'ELSE without
associated IF.'

```
/* Code Fragment */

if( preferences[ PREF_SMF_YES ].ob_state & SELECTED )
  { result = form_dial( FMD_GROW, DIAL_ORIGIN, DIAL_ORIGIN,
                 DIAL_ORIGIN, DIAL_ORIGIN, x, y, w, h ) ;
  }
else
  /* Do Nothing */ ;

/* End of Code Fragment */
```

I'd appreciate any help in solving the problem!

I've got an Atari CX22 trackball that I bought for a C-64 several years ago that I would like to use with
my IBM compatible; it would be great for my kids to use rather than the difficult to grasp and
operate mouse.

Has anyone ever tried connecting the trackball to the PC serial port, and if so, are there any instructions or
drivers available to interface with it?

Please reply to me at adillon@icthomasson.com

Thanks for any and all help.

Dont use present tense for something possible for the future - people might
get confused and think you are saying that this can be done.

> reminder messages. Take the sticky notes to the next level. You can even add
> audio sample support so that general midi instruments sounds can be used to
> notify you via SAM. You can record you voice to a reminder object and when it

SAM does not support MIDI, or GM. However, this sort of reminder is exactly
what SAA's are for...

Here we go again.

Issue 51 of ICTARI is now available at the usual place:

http://www.elis.demon.co.uk/ictari/ictari.htm

For those who don't know, ICTARI is the monthly(ish) disk-zine for Atari programmers at all levels. It also needs help in the form of contributions to survive.

This one's actually quite good, there a couple of "scoops" in the form of a letter about GEMMA from Paul Jones, it's creator, and the Cadenza Address Book with full sources. Thanks to all the folk with STOS WEB-sites, they were really useful for answering the queries of our latest subscriber. Tell your 'net-disenfranchised friends.

Have Fun,
"Augeas"

Does anyone have a list of Country Identifiers for the Atari?

It is held in _sysbase+$1C pre-TOS 4 and in the _AKP cookie otherwise.

I have got the table provided in the Atari A-Z but it looks as though
Profile and Sysinfo have different ideas about what value corresponds
with what country.

Could anyone fill in the blanks below (add if necessary)?
I'm especially interrested in DOS/AES versions for each.
Thanks to those who already provided some answers! ;-)

NOTE: followups to: "comp.sys.atari.programmer"

On Sun, 7 Dec 1997, Scott Harris wrote:

Why not have 2 arrays, one containing the strings, and one containing the
number of that record, e.g.

  Array1   Array2
 ======== ========
   1      "string"
   2      "string"
   3        ...
   4        ...
```

Then something like:

```
flag=TRUE
while(flag=TRUE)
  {
  flag=FALSE
  for(n=0 to size of Array1-2)
    {
    if Array2(n)>Array2(n+1)
    then
      flag=TRUE
      swap(Array1(n),Array1(n+1)
      swap(Array2(n),Array2(n+1)
    endif
    }
  }
```

Sorry about the strange mixture of C and Basic, but I haven't used GFA Basic before.

At the end you will have the strings in Array2 sorted alphabetically, and Array1 will still hold the corresponding record numbers. Obviously, I'm assuming that direct string comparisions can be used (they probably can't), and that swap is a valid part of the language (it probably isn't). You may have to implemnt these yourself.

The key things to remember are that when you move the contents in Array1 you must also move the contents of Array2.

The flag ensures that the sorting process continues until all the records have been compared.

Hope it helps.

Hi Tony,

I appreciate all the enthusiasm my site seems to have generated. I'm currently weak in the arcade area so its just beginning to evolve and I'm just beginning to make connections with people in regards to un-released and in-house Atari arcade projects, expect to see images and information on prototype and unreleased arcade equipment from Atari in the near future, I apologize that there isn't anything mysterious and exciting in that section as of yet, I hope you liked the rest of the site, take care and happy holidays.

Curt

6=Sweden

Thanks for this Martin-Eric. I have just realised that there are, in fact, TWO language codes for the Atari. There is the OS code in _sysbase and _AKP and there is also the AES Lang Code.

1. It is different from the AES codes above - 0 means "USA" and 3 means "UK".

AES Language code 3 doesn't exist, because US and UK both speak english. appl_getinfo(AES_LANGUAGE) returns the AES language.

However, OS Code and _AKP return the actual country, which is different from AES Language because each country has different preferences on the keyboard layout and video hardware (thus why you find it in _AKP).

I think it's more a case of Magic is looking at the machine it's being used
on and adapting it's TOS version to match. It seems this way since I use
Magic 5.11 on an STE and, although the date, GEMDOS and AES versions are the
same, it returns TOS 2.00

Try using a second array as the pointers to the strings in the first. That
way you can do tests on the string array, but only swap the elements of the
numeric array. Try this:

```
' Shell sort using an array as the index
'
' n&            number of entries
' si&           temp, used by routine
' f!            flag for swap, used by routine
' i&            temp, used by routine
'
' sort.me&()    index array
' s$()          string array, contains data to sort
'
PROCEDURE sort.array.using.index(n&)
  local si&,f!,i&
  FOR i&=1 TO n&
    sort.me&(i&)=i&-1  ! use '=i&' if you use OPTION BASE 1
  NEXT i&
  si&=n&
  DO
```

```
    si&=DIV(si&,2)
    EXIT IF si&=0
    REPEAT
      f!=0
      FOR i&=1 TO n&-si&
        IF s$(sort.me&(i&))>s$(sort.me&(i&+si&))
          SWAP sort.me&(i&),sort.me&(i&+si&)
          f!=1
        ENDIF
      NEXT i&
    UNTIL f!=0
  LOOP
RETURN
```

After calling the sort, you will be left with the unsorted array s$() and a 'sorted' array s$(sort.me&()). To find the raw record #, go directly to s$() and to find the sorted record #, go via sort.me&()

Finally, when saving the 'sorted' data, try this:

```
PROCEDURE save.the.sorted.data(filename.to.save.data.to$,n&)
  LOCAL i&
  OPEN "o",#99,filename.to.save.data.to$
  FOR i&=1 TO n&
    PRINT #99,s$(sort.me&(i&))
  NEXT i&
  CLOSE #99
RETURN
```

Hope this helps.

Regards,

David E-Mail :- dbolt@my-ste.demon.co.uk

iirc, the PC back then had two sorts: bus mice and serial mice, serial
being the most common I think - which don't have a lot in common with
atari mice (again iirc!).

>Does anyone know how to
>re-wire the mouse to woek the 286?

This being the programming group, here's a really daft idea ...

... someone could always write a little utility so that the atari
serial port sent the required PC serial mouse info when the atari
mouse was moved on the atari. Well, I did say it was daft!!

I don't use lattice. Nevertheless some of the following will be relevent.

>to complain about the placement
>of relocatable data more than 32K away from the statement
>using the data.

PC relative code generation is limited to a maximum of a 32K offset in either direction from the "base". The base can be "code" or "data". This varies from compiler to compiler but most can be told to turn off one or both options for any particular module. In your case it sounds like you need to turn off PC relative data addressing in the module attempting (and failing) to reach the data.

The other solution is to rearrange the module linking order so that the source and target fall within 32K of each other. Not recommended until an application is completed because you usually end up spending more time juggling modules about than code writing!

>So I've decided to use the 'make' feature (instead of just
>#including all the source files together).

Good. It is not unusual for a compiler to posess an upper limit to "compilation units". Lots of smaller source code modules are better than one big one, plus it compiles faster!

>The big problem:
>this code fragment that used to compile perfectly now
>causes Error 21: Illegal Use of Aggregate. Adding insult
>to injury, it also complains about an 'ELSE without
>associated IF.'

Pity I don't know what Lattice means by "Aggregate" but I'll make an educated guess that this is a preprocessing problem of some sort. See if there's an option to dump the output of the preprocessor to a file and examine it.

```
>/* Code Fragment */
>
>if( preferences[ PREF_SMF_YES ].ob_state & SELECTED )
>  { result = form_dial( FMD_GROW, DIAL_ORIGIN, DIAL_ORIGIN,
>                  DIAL_ORIGIN, DIAL_ORIGIN, x, y, w, h ) ;
```

```
>  }
>else
>  /* Do Nothing */ ;
```

There's nothing actually wrong here. Therefore it stands to reason that the compiler cannot moan about the else/if - but it does. This leaves the conclusion that the compiler is not seeing what you've written and this problem is almost always because CPP has changed what you've written into something else. Bear in mind also that just because the problem is noticed here, the fault might be quite a lot earlier.

The other common reason is a missing brace so that the "else" falls out of scope with its intended "if". I dismiss this here because you say it was ok before.

```
>
>/* End of Code Fragment */
```

You might find CPP has done something like this:

```
if (preferences[].ob_state)
```

...or ...

```
{result=form_dial(FMD_GROW,,,,,x,y,w,h);}
```

>I'd appreciate any help in solving the problem!

If there isn't an option for seeing the preprocessor (CPP) output then look up how #assert can be used.

I have no familiarity with Signum, as my Word processor is Calligrapher
(I'm happy with it). I transfer files from Calligrapher to Word 6 using
export files as Rich Text Format (RTF). This transfers all WP control
codes, and little is lose. Can Signum save files in RTF format?

Magic always returns an AES version of 3.99. I believe that it also returns
a different GEMDOS version to the ROM TOS, as it implements a number of GEMDOS
functions that are not in the earlier versions.

Yea, correct - although bus mice are all but redundant now (but not in
the days of 286s)

> This being the programming group, here's a really daft idea ...

Here is a slighty more practicle idea - albeit a tad difficult...

There are docs available instructing how to connect an Atari joystick
to a PCs joystick port. It would be feasible (AIUI) to write a mouse
driver for the PC to read from the joystick port and understand the Atari
mouse signals...

You need to turn off relative addressing and use absolute addressing. Relative
addressing produce a faster code but limit your data to be located up to 32K
offset from current address. Absolute addressing have no such limitation as it

is absolute (You can access all the 14 meg using this).

I do not use Lattice C so I do not know where you set this option but it is normally a compilation option.

```
>to injury, it also complains about an 'ELSE without
>associated IF.'

>  }
>else
>  /* Do Nothing */ ;
>
>/* End of Code Fragment */
>
```

Where is your semicolon at the end of else ?
Try to end your statement and see if it compiles.
I think that's your problem or is it you didn;t include all your code for that if-else statement here?

I would not even use those curly brackets as your IF statement is a simple one. Just as follows :

```
if( preferences[ PREF_SMF_YES ].ob_state & SELECTED )
       result = form_dial( FMD_GROW, DIAL_ORIGIN, DIAL_ORIGIN,
                 DIAL_ORIGIN, DIAL_ORIGIN, x, y, w, h ) ;
```

The "else" is also redundant as it is not doing anything. An optimising compiler will just ignore it as it produce code which do nothing.

Hi,
Signum II can't save in rtf. The best way we have found is:
1- save all images out of the file and convert them in a pc format
(gemview for example),
2- replace all "stranges" caracters (for example in french all letters
with accent) by a combinaison of caracters never used (I used | for ,
|| for , ||| for , ...),
3- save the file in ascii format; you loose the format of the pages.
4- import your ascii file in word and replace the "stranges" caracters,
5- save your file.
Good luck.

Hi Roger.

Trust PROFILE 2 and the A-Z :-)
PROFILE 2.2 is the most comprehensive and accurate program of its kind.
Sysinfo can't always be reied upon.

As far as a list of codes is concerned PROFILE 2 and the Atari A-Z should agree and *are* right. But please note, PROFILE 2 always reports what it finds not what the user expects it to find!

PROFILE 2 gets its country origins from 2 different places as you know and it depends on which page you are loking at for the results - page 1 for sysinfo and cookie page for _AKP. In addition there is also the NVRAM settings (where applicable) where the _AKP value is set at boot up and can also be different and of course modified after boot up to the cookie value. There is also a difference between keyboard nationality and keyboard language. Again, they don't have to agree it depends on what the user has set them to!

You must read the docs for clarification.

The codes at _sysbase+$1C and in the _AKP cookie (and in NVRAM) do not have to agree.

The former is hardcoded in ROM, the latter are softcoded and can be changed at will by any program as can any cookie.

Some emulators get the country code at sysbase+$1C wrong. Magic v4 does this and often incorrectly sets a US country code at this address. Naturally the _AKP cookie is usually set correctly for UK. Again, PROFILE 2 reports correctly what it finds!

Please contact me via email with specifics.

Hi Mark,

Ah... I was wondering if it might be a MagiC error - didn't see a
reference to it in my manual. Thanks!

>You need to turn off relative addressing and use absolute addressing.
One simple way around this is to use multiple C source files keeping each
less than 32K when it is compiled into its object file. Link them altogethr
in the project file.

Smaller C files also makes for faster editing, keeping related functions
together and faster compiling as you can keep stable functions together out
of the way in one file and the new currently developed functions in another.

> associated IF.'

There is nothing wrong with code extract you provided, we need to see surrounding code because errors can cascade and when the compiler finally gets around to telling you about it, it can point to an entirely different piece of code.

An aggregate is just another name for a structure or union. You can not test an aggregate as you can for the likes of short and long, any attempt to do so will result in the illegal use of aggregate message. For example:

```
typedef struct{
    short   t;
} T_TEST;

T_TEST  test;

void    main( void)
{
    if( test == 2 ) return;
}
```

This would generate error 21. Look for something like it in your code.

I am not joking when I say that one mis-placed semi-colon can wreak havoc
with your compiler, check everything.

Good luck, Jr.

Hi!

Is there a legal and reliable way of keeping track of which application
that's on top/in focus at any given time? I need this in my "Taskbar".

So far I've used both wind_get() (find the top window) and menu_bar()
(find the owner of the menu-bar), but they both fail under certain
circumstances. E.g. if a program owns the current menu-bar but has no
open windows wind_get() fails, and if the top application doesn't
have a menu then menu_bar() fails.

Sounds feasible. Do PC joysticks have >=2 button inputs? More
importantly - would a joystick driver be capable of handling input at
the rate a mouse wheel could send it?

Hmm, howzabowt leaving the mouse in the ST keyboard and taking the
input from the keyboard lead into a com port. finally there would be a
way of moving a PC mouse pointer via the keyboard!! ;-))

> this list is now corrupted and source is unavailable (corrupted also).

I found a backup of the list in a pre-release Toolbox from just over five
years ago [xmas 1992], and was able to partially reconstruct it. It lacks
AES version (the Toolbox ran from the AUTO folder before GEM was "awake"),
and some TOS versions were just too corrupted to make sense of.

```
   1.00   0.0D Disc 1985-05-29 (Country=0, unknown)
   1.00   ?.?? ROM  1985-11-20 (UK)
   1.02   0.13 ROM  1987-04-22 (UK)
```

```
   1.04   0.15 Disc 1988-08-08 (UK - "Developer only")
   1.04   0.15 ROM  1989-04-06 (UK)
   1.06   ?.?? ROM  1989-07-29 (UK)
   1.62   ?.?? ROM  1990-01-22 (UK)
   3.05   0.19 ROM  1990-12-05 (UK)
```

These are all the TOS versions I have either owned or written for (My TT [in front of me] has 3.05, my old Mega ST [now in storage] has 1.02)

```
> >  > >
> >  > >   TOS   Date       GEMDOS  AES

```

> I used to have a copy of Disc TOS (1.00), but have lost it. I faintly
> recall GEMDOS 0.13 and AES 1.0 - but don't quote me.

The version I had was actually GEMDOS version 0.0D (hexadecimal). And from memory AES was 1.01 (not 1.10 as I recalled previously)

And "Developer only" TOS 1.4 (on disc) had AES 1.3, I think.

I'm not sure what you mean by "secure browser", but atleast the MiNTNet OVL for CAB supports authentication and can be compiled with SSL. I believe

(although I have never used it) that never versions of the CAB-OVL for STiK
/STinG also supports authentication.

Yes, there are problems with GFA-Basic under MagiC or Geneva, but they can be solved. Search for Vegard Hofs►y►s homepage (author of Face Value), he has some patches.

> Second, what are the advantages/disadvantages of using Magic and Geneva?

The obvious disadvantage is that it uses some memory. Geneva use a bit less than MagiC, but unless you have TOS 2.06 I►d recommend MagiC over Geneva.

If you have 2.06 then it►s really just a matter of taste. Geneva is more compatible if you use midi-programs or older apps, but MagiC is slightly faster.

> Third, is Geneva still available and, if it is, where from?

In UK Geneva is available from Titan Designs.

> Is it like writing a CD? I am a
> programmer with an Atari (ancient though). Is there a kart that lets you
> program other karts?

Ah! you mean a Jaguar game, right? or Lynx? or the old 8-bits?
Not the ST->Falc series, I assume.

Seriously though... for the Jaguar at least, you need a complete development
system (either Atari's own, which you probably cannot get anymore), or a
modified Jaguar (the "Jaguar Server") and an Atari computer. However, with
the Jaguar Server option, you will not be able make carts, as they are
encrypted, and Atari have never (AFAIK) released information about the
encryption algorithm used - so Jaguar Server games can only be played on
other Jaguar Servers (much like the Playstation Yuroza)

I hope this is of some use...

You can get most patch programs from Columbus Soft, Germany
mailto:christof_schardt@of2.maus.de

If using MagiC I►d advise you to use Ergo!-pro. That►s an IDE for GFA-Basic
and Face Value, also available from Columbus.

There is an FAQ about such questions (only in German). I could post it here
if you whish.

To all Face Value/GFA-programmers: have a look at my website, there are some
links to Face Value-related sites (files -> Face Value FAQ/Face Value UTIL)

  Hi, all. I would like to get as much info about the Crazy Dots line of graphics cards. I know that there are two versions, but suspect there are more? I don't know much about these cards, so feel free to input all you might know about them. I specifically want info about the ones for use with a TT.

Thanks..

Hi There

I'm a long time user of the ST ,Have s 2 meg 520STe with a colour monitor and a 240meg HD and the one piece of software I have been looking for all these years is the multitasking software package GENEVA can't seem to find out who sells it,any idea where I could pick it up and how much?

any reply would be really appreciated

Bill

I want to do some programming with MIDI on the ST....i'm looking for some language that reads the incoming data on the midi port (and that's also able to send ofcourse...)

Can anybody help me? What should I use?

Just get the GFA patches and don't forget to free any memory
you don't need at the start of the program
(eg. use RESERVE <new amount of mem>).
And you'll have to write clean GEM code. (don't use GFA's window routines
for instance, although I don't know why...) And don't write into memory
that doesn't belong to your program.

: Second, what are the advantages/disadvantages of using Magic and Geneva?

Advantages: you get, among other features, multitasking and cool GEM extras,
and (at least with MagiC) a nice speed increase.

Disadvantages: Takes up a bit more memory than plain TOS+GEM, shouldn't
be any problem with 4 Mb though...

One piece of information missing from the Compendium, is
a list of features typically found with each TOS version.

Could anyone fill in the blanks below (add if necessary)?

TOS	Date	GEMDOS	AES
1.00			
1.02			
1.04			
1.06			
1.62	01-01-1990	0.17	1.40
2.02			
2.05			
2.06	11-14-1991	0.20	3.20
3.01			
3.05			
3.06	09-24-1991	0.20	3.20
4.02			
4.04			

MultiTOS

4.92	
	4.1

You can use any langage. Just take a;look at gemdos or Bios function in
order to read, write to midi port. Notice that reading and writing
function of the TOS need the port to be OK to receive or read. Meaning
that if you try to read as nothing is coming, your software will waut,
wait, wait.... until someting really came from the port! So, use other
Bios or gemdos function in order to ask "Is there something comin?"
before you try to read. That's the same for writing.

You're thinking of either the 2600, 5200, or 7800 game machines.

>It works only with a regular tv, two joysticks, and a black box where
>you put the kart in.

Then it's the 2600, with the Basic Programmer cart, unless the Jaguar came
out with a programming kit.

The next item from Atari that could be programmed using Basic was the 400
with 16K, a 410 or 1010 Recorder, and the Basic cart, together with the
Programmer's Toolkit, if I'm remembering the name right. Way back then,
around 1981, when I bought it, the total cost was about $300. Today, it's
worth maybe $10 or less.

Sorry, you must have missed my sarcasm. :)

"Atari" covers > 7 different computers/consoles... For the machines that
do not have keyboards, you usually have to use another computer to develop
on - getting hold of a development kit for a console, is not easy...

Hmm... sounds like an 8-bit to me, but depending on what you call a joystick,
it could be a Jaguar, I suppose... I dont know anything about the old 8-bit
machines.

Greetings,

We are currently gearing up software development for the following hardware platforms:

Atari Falcon/TT/STe, Amiga, PC, Mac, Acorn A7000+/Risc PC

Regarding the Atari systems, we are bound to require the following minimum platform:

At least 020, 256-color mode, 8-bit DMA sound, hard drive

Of course, the Falcon version will have some improvements. It is my current task to research the capabilities of various graphics cards available for the TT/STe as well as the CPU upgrades to determine their viability as games development targets. The TT clones on the market are also being targetted.

In addition, we are seeking the technical OS developer's manuals that Atari released, including Falcon information. We have already gained access to DSP 56001 data book, a 68020+ assembler, a MIDI synth, and the "Atari Compendium" reference. However, this is not sufficient as we require much more TOS data and especially data on the networking ports and such. As Atari was absorbed by JTS, we cannot get data from them.

We would certainly appreciate any info or Atari users could give
us. We would also like more information about "C-Lab", the company
that has the rights to the Falcon.

My sincerest thanks,

Tm2, Atlantis Software Development/HD

There are no 020s in the Atari world! It looks like your minimum setup
is the Falcon 030 and TT.

If you want to sell the games, you might want to target the widest
possible target. This probably excludes add-on graphics cards as they
are widespread.

This should all be in the Compendium. Don't know where you can find this
though. An atari dealer might have still have it.

This is not true !!! I have a 68020-68882 in my MegaST; it is called the PAK3
accelerator from Germany (MW Electronic). :)

(I guess you can count the owners of 68020 ataris with only one hand !!! :)

Hi

I'd like to access MiNT-Net functions with PureC. Does anyone know where
I can get a PureC-library for this purpose? Is there somewhere a free
C-source code for doing SMTP and POP3?

Thanks for any advice.

Greetings

Daniel Schaller

Certainly not ! The PAK was one of the most popular projects of the c't magazine,
and I guess even in the Atari world there might be still one to two hundred
of them.

Cheers Peter

Greetings all, I've just completed a small GEM password programme which takes advantage of the #_AUT feature in MagiC. Although it works well, it's easy to delete it via the Task Manger (alt+control+esc).

Does anyone have any idea as to how to disable the Task Manger in C ??
My compiler is LC 5.60.

Thanks,

All righht, all right, there are 020 based machines... but the guy said
020 and DMA sound, sound I guess you don't qualify anyway.

How I like having th last word ;-)

: Of course, the Falcon version will have some improvements.
: It is my current task to research the capabilities of various
: graphics cards available for the TT/STe as well as the CPU
: upgrades to determine their viability as games development
: targets. The TT clones on the market are also being targetted.

You can get a graphics card suitable to produce almost any display you like. On Atari systems with inbuilt graphics capability, however, most people don't use a graphics card.

: In addition, we are seeking the technical OS developer's
: manuals that Atari released, including Falcon information.
: We have already gained access to DSP 56001 data book, a 68020+
: assembler, a MIDI synth, and the "Atari Compendium" reference.

The Atari Compendium should contain virtually everything you need to know.

: However, this is not sufficient as we require much more TOS
: data and especially data on the networking ports and such.

What mora data could you want? TOS is covered entirely in the Compendium. I don't know what you mean exactly by networking ports. If you mean the "LAN" port, this is simply a serial port (as explained in the Compendium).

To have some other kind of network interface you would need to get an additional card. The method for accessing the network depends on the software being used, but you could look at STiNG and MiNTNet since these seem to be the most popular packages that support more than just SLIP or PPP for the internet. You could only use one of these packages if a driver was written for it for the network card being used, of course. A few drivers for, I think, VME network cards are included with MiNTNet.

: As Atari was absorbed by JTS, we cannot get data from them.
: We would certainly appreciate any info or Atari users could give

: us. We would also like more information about "C-Lab", the company
: that has the rights to the Falcon.

C-LAB makes a few Falcon clones, but they have not really improved them at all. They are in a new case and have a few minor modifications done, that's all.

Terry,

What type of error message? I can't type in the whole Atari Compendium! But if you have access to one, that is probably the most complete resource that I have seen.

Bud,

  Well, I have a whole new set-up here: TT, Magic, NVDI, Nova card -
I have no prior experience with any of these items. Basically, I'm
wondering if there is an online document listing the extended error
codes. I've just recently started actually doing any programming on
it, so at the moment, system errors are the most important thing.

For one specific example: "Program returned 68000 Exception error -
Error -69" - my references only go up to error -64

Thanks,
Terry

Hi,

You can find a copy of the excelent PacifiST Atari
Emulator. You can find information on PacifiST and
other Atari emulators from:

http://www.jetman.demon.co.uk/st/

Regards,

Ben Hills.

It's a simple password programme which stops access to the desktop until
the correct password/key is typed. It uses BubbleGEM, so it means the
programme is non-model, and displays a message using BubbleGEM if an
incorrect password is entered. After the 3rd failed attempt it locks up
the computer. It also logs all attempts with time & date plus the
attempted password to a file.

I'll upload it to <ftp.funet.fi> and <ftp.cs.tu-berlin.de> once I've
finished the docs, there's not to write, I've just been a little lazy
and I hate typing. ;-)

Hello! In the Atari blitter manual there is a section that says the blitter
can do bitmap rotation with recursive sub-division. Does anybody know
how to get the blitter to rotate bobs? Maybe it only works for 90 degree
rotations? Anyway if anybody can shed some light on the subject I would

appreciate it.

My last bob routine (soon to appear as the intro in the new issue of PB) can mask and or 31 32*30 2 plane bobs a frame with clearing on a standard Ste and it could be optimised further. I wish the Ste blitter would and then or a word in 8 cycles instead of 24 cycles like the Amigas one :(

C-ya!

Is there any possibility to transfer/read a 70-pages text-file written
with
signum II (on an atari 1040st) to/on a PC ? Is there any emulator to read
the atari-formatted disk (3,5"). At least we would need an ascii-file.

Thanks for your help

Thanks. I had figured it out after words, I just misread the manuale for the printer. I had to write a rountine which converts the string codes into varibles and then sends each varible to the printer with OUT command. I had to do it this way because alot of codes are being send to the printer to configure it, in a way the user defines. So using I would have had to make a number of functions, rather than one routine which when called send whatever the user defined as the setup.

Thanks again...

Scott.

tfork is just a bit of wrapper code around Pexec. It's provided in the MiNT library. Basically it allocates a base page and a stack, stores the passed-in function address as the start address of the new basepage, then Pexec's (using I forgot which mode, new process using existing memory image) to start the new process. The process is considered a "thread" in that it shares the contents of the parent's address space - all code, data & bss space. Heap is a separate issue which generally is not taken care of. Specifically, malloc() and related routines cannot be used safely by the new process. The stack is initialized; as I recall a call to Pterm is stored on the stack so if the new process returns all the way to the top, it exits.

(Note - malloc is a problem for two reasons - the obvious one, thread re-entrance and mutex issues, but also because the MiNTlib malloc() tries to do stack/heap collision detection. In the original process, the heap and stack are both carved out of one chunk of memory, and the heap grows upward from the bottom, and the stack grows downward from the top. If they meet in the middle, malloc has to give up. In the threaded subprocess, the stack is in a freshly allocated memory region, but the heap remains where it was in the parent process. The new stack could be either above or below the original one, so the library's collision detection code is useless.)

I've written a couple of pieces of code that used this function, (including the first pass at my update to the MiNTnet driver for CAB) and I've dissected it quite a bit. It seems to me that the Pexec functionality it uses is a bit broken; the new process doesn't share the file descriptors of the parent process, for one. Also, it seems to be dependent on the memory-sharing flags set in the parent; one would expect that a "thread process" automatically inherits full access privileges to all of the parent's memory, instead of just read access. I've never investigated the MiNT kernel code to verify this behavior, but I believe there's a bug here that needs fixing...

I desperately need info about the mode $5364 of Fcntl(). This is a call dealing with sockets, I think and I think I'm starting to understand how it works. But I've not been able to find any docs about this mode. anyone?

Well, as its sockets I guess the place to look is MiNTnet - either in a
man page, or more likely in the source the the .XDD file - as this is where
the Fcntl on sockets is probably handled.

Hope this helps

Anthony

Atari is using the same file system as PC (FAT)
so if you have program for reading PC disks
you can read/write Atari disks.

Hi

I've just been playing with PPP-Connect (that I bought at today's show,
along with CAB2.5).

I'd like to add PPP-Connect compatability to POPwatch if it's not too difficult.

Can anyone tell me where I can get hold of the programming docs for PPP-Connect?

Regards,
Gary

Would anyone be able to tell me where I can obtain a good (i.e. user
friendly) C-compiler for my Atari ST. Also has anyone written a program
whereby I could use one Atari ST as a file and print server for two
other Ataris, or would anyone else be interested if I wrote one myself?
This might sound slightly silly, but I'm trying to squeeze that extra
little bit of use out of them.

Cheers,
Gerard

There is a hardware/software network which uses the midi port
available commercially.

I started writing one using the serial port, but it kept dropping
bytes. Eventually I discovered that the problem was that the
default serial buffer was too small to really handle 19200 bps, but
by then I was no longer interested in networking my ST and TT.

Same here, CAB 2.5 really flies now, and thats with STiK (1.12).

>I'd like to add PPP-Connect compatability to POPwatch if it's not too

I'd like to do the same with Greendale (when I finish it) and perhaps port
GlueSTiK to it.

>Can anyone tell me where I can get hold of the programming docs for

I thought it was based on BLIP (they are buy the same author and are very
similar) but the BLIP examples don't work so I guess that something was
changed.

AFAIK, PPP-Connect is a port of Berkley sockets so is programmed like
MintNet.

Look out for Pure C which is very user friendly. It however produces slightly
less than optimal code. If you can't live with 98 % of the optimum, you must
go for Gnu-C, but that one for sure is not very user friendly.

> Also has anyone written a program

Sure, go ahead. I thought about just doing the print server/client bit the
other day, as it's rather easy to do (using STinG). A file server is tricky
however, but will come one day too.

Cheers Peter

The only thing I know is that it's supposed to be some sort of "intelligent" compression, like DCC and MD. I doubt that Steinberg would give away their technology, but who knows - since they won't make any more CAF upgrades (let's hope they'll continue making bugfixes) for our beloved computer, maybe they would eventually?

There are many networking type programs & file servers, check umich for a few.

If you have the memory & disk space, you could install MiNT & MiNTnet & get a
fully working NFS connection between the two atari's.

Do you know where I could get a copy of MiNT, and MiNTnet, since I haven't been
watching the Atari world
for quite a while. You couldn't send me a copy could you, or is MiNT no longer

shareware?
Also, you suggested checking 'umich'. What is this?

Cheers,
Gerard

> It's used by Xbios as starting in 1968, in binary mode, giving a max
> year of 2223, limited by Xbios (and Gemdos as well) to 2107.

This is wrong, the limit is 99 EVEN in binary mode ....
I just looked to Motorola and also Benchmarq documents
in fact you can put any value in , but it just WON'T get
updated properly when it should ... in the specs the
limit in binary mode is given by motorola to be 0x63
(99) because the chip is intended to be a '100 year calendar'
as they say ....
In other words you can put in 2053 for example but when
it should become 2054 it will loop back to 1968 again :-(
I wonder why they kept this limit ?
So the limit we were searching for is 1968+99 which
is 2067 which seems to be the real atari limit ,
according to Motorola ....

By the way , you were right , day 1 is sunday !

so long,

DAVID GODEC

Hi Gerard,

: friendly) C-compiler for my Atari ST. Also has anyone written a program
: whereby I could use one Atari ST as a file and print server for two
: other Ataris, or would anyone else be interested if I wrote one myself?
: This might sound slightly silly, but I'm trying to squeeze that extra
: little bit of use out of them.

If you do it, I suggest you to use the Unix lpr standard via STIK. This
should be the most flexible solution for printer Servers. Almost any
System available supports it. For using it with existing software you

should best do it as a GDOS driver - optimally for NVDI if you get
hold of a documentation.

For a file Server NFS is the best sollution. ther is NFS for MiNTNet.
Still it can not be used by the majority of users who have not enough
Memory.

Christof

GNU binutils already include lots of binary formats. Not including the
Atari's one by default, but there is a patch to add it (to an old version,
and I've no idea whether it would apply cleanly to a current version).

Hi
Trying to make a game with sprites seems to be the best solution to
use the "flipping" screen method for animation (Setscreen())...
...but this is very machine dependent: I use a TT and Crazy-Dot
graphic card and if there are no problems in TT (video) standard mode
it's no possible use the same method with Crazy-Dots in 256 colors mode.

Is it possible that I make some mistakes about the screen-base address
or there is athers "standard" methods ?

Thank you

Maybe the cartridge slot would have been better (faster) solution. The
only problem here, is that you would have to have designed your own
hardware, and Atari's strange decision to make the Cartridge slot
one-way would have made this task slightly harder. It's understandable
why commercial manafacturers opted for the midi ports, even though this
stops the networked Atari's from using the midi ports for music!!

Gerard

You have a good idear, I didn't thought printing was possible thrue NFS,
but when you think about it this should be done linking a file to the
target device on the server, and by allowing others to access to it via NFS.
A good way to to this would be a graphical configuration software for MiNT.
I'm still thinking about one, but I'm not sure to have the knowledge to
make it myself... but it would be a great thing, wouldn't it ?

Actually it would be perfectly feasible to implement a network over a MIDI system without preventing its use for music (although timing might become more of an issue). The MIDI spec includes a message type called "system exclusive" which is designed to implement device specific messages not catered for in the normal MIDI commands. There's no reason why this message couldn't be used as a "wrapper" for network packets, and it they would be safely ignored by normal MIDI equipment.

The actual topology of the network might lead to a few more problems, as it would effectively have to be connected as a token ring, which is not ideal for every MIDI system, and may prevent some MIDI or network traffic being passed correctly. In practice, with some planning, and if the network isn't being used for MIDI and file/print at the same time, the problem can easily be minimized.

All this was discussed at some length on the MiNT mailing list quite some time ago, but nobody ever wrote the necessary routines into a MiNTNet driver (my programming skills aren't good enough for me to take it on). Shame.

Cheers,

Xav

THE MC68060 CLOCK

Some people and some companies, especially french ones, announce
the 68060 to be cadenced at 120 MHz on the HADES 060.
This is totally wrong and only reflects the technical ignorance
about the 68060 and the marketing lies of some companies !

The 060 is cadenced by only one clock : the CLK (that is the PCLK
of the 040 socket !).

You have to know that the 060 is built with the 'STATIC' technology
that allows this 060 to be cadenced with lower frequencies, even 0 MHz
(no clock at all) in the purpose to reduce consummation as much as
possible... But, the way to exit this mode is to send a non-masked
interrupt or a RESET to the 060.

Therefore, the 060 has an internal clock control logic which
itself is also cadenced by an internal clock, which works constantly !
Yes, it's this logic which gets the interrupt and exits the 060 from its
'low power mode'. This is also the logic which stops or starts the
PLL (phase-lock loop), which has to synchronize the external clock with
the internal clock ! It constantly monitors this PLL and if unphased,
returns an external signal LOC/ (Loss Of Clock).
This signal, for example, is a variation of the CLK sent to the processor.
The clock can only be modified during RESET or LOW POWER MODE !
Therefore, the 060 can't (in real time) do an external DX2 like it is
possible on some accelerator cards (CENTurbo II, CENTurbo I 20/40 (1st
generation), Speed Resolution Card, etc...).

Let's turn theory into practice :
Just a little demonstration with a FALCON, an HADES 060, and GEMBENCH
4.03 with the INTEGER DIV test which consists of DIVU.W dx,dx.
We read the timings for this DIVU in the Motorola DATABOOK of the 030
and the 060.
For the 030: 44 clock cycles to execute the DIVU.
For the 060: 22 clock cycles to execute the DIVU.
We launch GEMBENCH 4.03 and the INTEGER DIV test (ref. FALCON) on :
FALCON STANDARD 16 MHz : 100 % (normal !).
HADES 060 at 60 MHz (!): 320 % (767 %).

Here is the equation, no comment.
68060 at 60 MHz = (44/22) x (60/16) = 7.50 or 750 %

On the one hand, we have the theory with the DATABOOK (if some people want to interpret the DATABOOK differently, we ARE LISTENING!) which gives 750 and on the other hand, a real test on a machine which gives 767 !
So, the hypothesis for the 060 at 60 MHz is proven correct.
If the 060 was at 120 MHz, like some people would stupidely like us to believe, the gembench test should have been closer to :

1500 = (44/22) x (120/16) !

Remark : The BUS of the HADES 060 is cadenced at 30 MHz !

A little bit of COMMON SENSE : why would a processor manufacturer announce on its processors a clock which would only be half of what the processor calculates for real ?!! Have you ever seen, a manufacturer half under-estimating its products against the competition?
Moreover, to not even talk about it in its documentations ??!!!
Us, Never !

CONCLUSION : The 68060 is cadenced at 60 MHz (the clock input !)
even if there is an internal DX2 clock !

Rodolphe Czuba
Sacha Hnatiuk
David Godec
Thanks to Emmanuel Barranger (EB MODEL) for his help.

My only regret is the same as the one about the 040 !
Moral : before believing and/or stupidly repeating the proposals of others, verify for yourself, or verify it with REAL professionals!

THE MC68040 AND MC68040V CLOCKS

Some people and some companies, especially french ones, announce the 68040 to be cadenced at 64 MHz on the AFTERBURNER 040 or on the HADES 040.
This is totally wrong and only reflects the technical ignorance about the 68040!

The 040 is cadenced by two clocks: the BCLK and the PCLK.
The BCLK (Bus CLocK) cadences the processor, its bus controller, as well as the entire calculation unit (and the floating unit for the 'full' 040, meaning with a FPU).
The Motorola DATA BOOK for the 040 is very clear about it because on page 10-4, we can read: 'All timings are related to BCLK cycles...'
By all means, when you read the instruction timing tables for the 040, and for example, it says that the XXXX instruction is 4 cycles that means that this instruction is executed in 4 clock BCLK cycles!!
About the PCLK (Processor CLocK), the 040 needs it to cadence its internal logic, especially its pipeline.
This clock could be 200 or 500 MHz, which wouldn't change the performance of the 040 !!
In this case, the PCLK is twice the BCLK with a phase shift + or - 250 to 500 ps depending on the clock generator used.
With regards to the design, you can give a PCLK divided by 2 to get the BCLK.
A more popular approach is the opposite starting with a BCLK multiplied by 2 with a circuit to obtain the PCLK.
Motorola proposes a MC88915 circuit, which is also used by the Afterburner.

A remark : the 040 3.3V model only exists in two versions :
- The 68040V which doesn't have an FPU !
- The 68EC040V which has neither an FPU, nor a PMMU !

These two versions are identical to the 5V version regarding the performance (otherwise, where are the instruction timing tables of this 3.3V version in the DATABOOK which talks about ALL 040 models ?!!).
The only differences are the 'LOW POWER' possibilities of this 3.3v version which are explained in the appendix C of the 040 DATA BOOK. With the version V (like on the 060 !!), there's only one clock injected in the processor : CLK (CLocK).
Of course, this clock is equal to the BCLK, located at the same place on the casing as the BCLK !
So why only one clock and what happened to the PCLK ?

You have to know that the 'STATIC' technology allows this 040 (and the 060) to be cadenced with lower frequencies, even 0 MHz (no clock at all) in the purpose to reduce consummation as much as possible...
But, the way to exit this mode is to send a non-masked interrupt to the 040.

Therefore, the 040 (and the 060) has an internal clock control logic which itself is also cadenced by an internal clock, which works constantly !
Yes, it's this logic which gets the interrupt and exits the 040 from its 'low power mode'. This is also the logic which stops or starts the PLL (phase-lock loop), which has to synchronize the external clock with the internal clock ! It constantly monitors this PLL and if unphased, returns an external signal LOC/ (Loss Of Clock).
This signal, for example, is a variation of the CLK sent to the processor.
The clock can only be modified during RESET or LOW POWER MODE !
In the case of an active LOC, it is necessary to send a RESET to the processor, restarting it again in NORMAL mode.
Therefore, the 040, as well as the 060 can't (in real time) do an external DX2 like it is possible on some accelerator cards (CENTurbo II, CENTurbo I 20/40 (1st generation), Speed Resolution Card, etc...).

Let's turn theory into practice:
Just a little demonstration with a FALCON, an Afterburner 040, and GEMBENCH 4.03 with the INTEGER DIV test which consists of DIVU.W dx,dx.
We read the timings for this DIVU in the Motorola DATABOOK of the 030 and the 040.
For the 030: 44 clock cycles.
For the 040: 27 clock cycles.
We launch GEMBENCH 4.03 and the INTEGER DIV test (ref. FALCON) on:
FALCON STANDARD 16 MHz: 100 % (normal !).
FALCON + AB40 at 32 MHz: 320 % (411 % at 40 MHz).

Here is the equation, no comment.
68040 at 32 MHz = (44/27) x (32/16) = 3.26 or 326 %

On the one hand, we have the theory with the DATABOOK (if some people want to interpret the DATABOOK differently, we ARE LISTENING!) which gives 326 and on the other hand, a real test on a machine which gives 320 !
So, the hypothesis for the 040 at 32 MHz is proven correct.
If the 040 was at 64 MHz, like some people would like us to believe, the gembench test should have been closer to:

652 = (44/27) x (64/16) !

A little bit of COMMON SENSE : why would a processor manufacturer announce on its processors a clock which would only be half of what the processor calculates for real ?!! Have you ever seen, a manufacturer half under-estimating its products against the competition?
Moreover, to not even talk about it in its documentations ??!!!
Us, Never !

CONCLUSION : the 68040 is cadenced by the BCLK !

Rodolphe Czuba
Sacha Hnatiuk
David Godec

My only regret is that I placed confidence in what a person and a magazine said, so I announced the same crap in the first version of the PHENIX 040/060 presentation file before discovering the truth myself (during the PHENIX development).
Unfortunately, a lot of people are still fooled by this falsified information ! Some even were hoodwinked into buying...

Moral : before believing and/or stupidly repeating the proposals of others, verify for yourself, or verify it with REAL professionals!

THE TRUE CLOCK OF THE MC68060 (the end of the liars ?)

Just a little demonstration with a FALCON, an HADES 060, and
GEMBENCH 4.03 with the INTEGER DIV test which consists of DIVU.W dx,dx.
We read the timings for this DIVU in the Motorola DATABOOK of the 030
and the 060.
For the 030 : 44 clock cycles.
For the 060 : 22 clock cycles (page 10-16 of the DATA BOOK !)
We launch GEMBENCH 4.03 and the INTEGER DIV test (ref. FALCON) on:
FALCON STANDARD 16 MHz : 100 % (normal !).
HADES 60 at 60 MHz : 767 %.

Here is the equation, no comment.
68060 at 60 MHz = (44/22) x (60/16) = 7.50 or 750 %

On the one hand, we have the theory with the DATABOOK (if some people want to interpret the DATABOOK differently, we ARE LISTENING !) which gives 750 and on the other hand, a real test on a machine which gives 767 !
So, the hypothesis for the 060 at 60 MHz is proven correct.
If the 060 was at 120 MHz, like some people would like us to believe, the gembench test should have been closer to :

1500 = (44/22 x (120/16) !

REM : The BUS of the HADES 60 is CLOCKED AT 30 MHz !

Newsgroups: comp.sys.atari.programmer

Hi guys

Some DOS software and Windows software can automatically detect when summertime etc. begins and ends. I'd like to do the same on my Atari.

The Supported DOS software will also change automatically if the 'GTZ' environment variable is set correctly to:

   GTZ=GMT0BST1,M3.5.0/01:00,M10.5.0/02:00

Can anyone tell me how a program interprets this variable?
It's the M3.5.0 and M10.5.0 bits that I don't really understand.

TIA,
Gary

This is probably a hopless thing, but if anyone can help I would appreciate it.

My father-in-law wrote an opera using an Atari computer hooked up to a synthesizer. I can get the details on the Atari model, but it is about 5 years old and uses a double density 720k floppy format with no hard disk drive.

Now there are two opera companies that want to perform the darned thing and he needs to get it into IBM PC format.

The way I see it there are two problems. First, getting the data from the Atari double density floppy onto a quad density disk in a format that IBM computers can read. He called a data conversion company in NYC and they basically balked at it due to its MIDI format. Second, translating the data. The software package he used has an IBM version and he has contacted them. Needless to say this was way beyond the capabilities of their Help Desk to handle, so they are ignoring him in the grand tradition of software Customer "Service".

I know- this is probably a hopeless task but I hope their may be somone out there who can help.

Kevin

No, as it is proprietary and thus would not work in many environments.
Instead, I fully support Christof's suggestion to use the Unix lpr standard, like I also mentioned in my other message here.

Cheers Peter

Please note with STinG you can use both the Midi port and any serial port
at the same time for TCP/IP networking. It's true there is no printer
client/server yet. But instead of trying to built a self-contained system,
I'd suggest to let STinG do the low level stuff, and instead concentrate
on the client/server functionality. You'd end up with much improved flex-
ibility (you can use Ataris or PCs running Linux for instance as either
clients or servers too; you can built bigger networks with many machines
and only one print server, instead of connecting only two machines; you'd
have additional services, like file transfer (FTP), and shared filesystems
later on), and yet do not have to bother with the low level networking stuff,
saving lots of work. Note the STinG and STiK application programming inter-

face is especially designed for use by programmers unexperienced in network programming, therefore easy to use.

Cheers Peter

Yep. Those calls are defined only for ST standard video hardware. They do not work with most other video hardware, like the Crazy-Dots or similar.

> Is it possible that I make some mistakes about the screen-base address
> or there is athers "standard" methods ?

The mere mistake is using these calls. They are XBios calls which only supports standard hardware.

For being compatible with add-on video hardware you definitely need to use VDI exclusively. VDI does not have any means to do screen flipping, because many hardware add-ons do not have the hardware to make it possible. So you need to stick to other methods (supported by VDI).

The atari disk drive hardware is compatible with the PC hardware -

both machines can read & write data from the other. The problem lies in the software and in this case the fault lies with the PC being much too fussy over what is acceptable. Both machines can read and write double density floppies which use 80 tracks, 9 sectors per track.

If you still have access to an atari it is well worth formatting a double density disk (720k) on the *PC* and copying the files off the atari floppy onto the PC formatted floppy (don't do it by dragging one ST drive icon over the other - iirc this causes a format). The PC should then be able to read them, provided the atari originally formatted them in the standard double density format and the midi package hasn't got in on the act.

If this fails it could be for a number of reasons and I assume time is of the essence here. All a data conversion company really needs to know is that the atari floppies are *physically* and *logically* PC compatible. An atari floppy ...

a) can have any number of tracks (typically 80-83).
b) any number of sectors per track (typically 9 or 10).
c) any number of sides (it'll be 2 though).
d) 128, 256, 512, 1024 bytes per sector. (it will be 512 though).
d) 99% compatible bootsector.

... if the crucial info in the bootsector is interpreted correctly the data can be transferred.

Btw, if the atari disk was formatted from the standard atari desktop then it will already match the PC double density format exactly, except for a couple of irrelevent bytes in the bootsector. It's these irrelevent bytes which cause the PC to think the floppy is corrupt. A low level dumb copier should be able to produce a copy whereupon the copy's bootsector can be patched or overwritten with a PC one - don't do it to the original!

1. If the Atari is still working, you can copy the disk onto an IBM formatted DD disk.
2. As far as the MIDI proprietary format, the easiest thing would be to MIDI up the Atari to an IBM as Master /Slave and play the Atari while MIDI recording on the IBM. (or a keyboard that has sequencing capabilities).
3. Many of the Atari sequencers were able to save as a SMF, in addition to their own format. (Though you may lose some information).

Hi!

In article <40609311_000003_OASIS_NEWS@the-gap.demon.co.uk>,
     gary@the-gap.demon.co.uk (Gary Priest) writes:
>   GTZ=GMT0BST1,M3.5.0/01:00,M10.5.0/02:00
>
> Can anyone tell me how a program interprets this variable?
> It's the M3.5.0 and M10.5.0 bits that I don't really understand.
M3.5.0 stands for "5th sunday in March", which in fact means the last
sunday in March. The 3 is March, 5 is the week, 0 is the weekday,
where 0 is Sunday, 1 Monday, and so on.

In the same manner, M10.5.0 represents the last sunday in October, which
is the date the summertime ends.

I've included the complete documentation for the $TZ-format, as this is
not the only rule format for the swichting dates.

Hope that helps ...

-- cut here --
```
      TZ          TZ sets time zone information.  TZ can be set using the
                  format:

                          [:]STDoffset[DST[offset][,rule]]

                     where:
```

STD and DST Three or more bytes that designate the standard time zone (STD) and summer (or daylight-savings) time zone (DST) STD is required. If DST is not specified, summer time does not apply in this locale. Any characters other than digits, comma (,), minus (-), plus (+), or ASCII NUL are allowed.

offset offset is the value that must be added to local time to arrive at Coordinated Universal Time (UTC). Offset is of the form :

```
hh[:mm[:ss]]
```

Hour (hh) is any value from 0 through 23. The optional minutes (mm) and seconds (ss) fields are a value from 0 through 59. The hour field is required. If offset is preceded by a -, the time zone is east of the Prime Meridian. A + preceding offset indicates that the time zone is west of the Prime Meridian. The default case is west of the Prime Meridian.

rule rule indicates when to change to and from summer (daylight-savings) time. The rule has the form :

```
date/time,date/time
```

where the first date/time specifies when to change from standard to summer time, and the second date/time specifies when to change back. The time field is expressed in current local time.

The form of date should be one of the following :

Jn Julian day n (1 through 365). Leap days are not counted. February 29 cannot be referenced.

n The zero-based Julian day (0 through 365). Leap days are counted. February 29 can be referenced.

Mm.n.d The d day (0 through 6) of

```
                                                  week n (1 through 5) of month
                                                  m (1 through 12) of the year.
                                                  Week 5 refers to the last day
                                                  d of month m. Week 1 is the
                                                  week in which the first day
                                                  of the month falls.  Day 0 is
                                                  Sunday.

                                         time     Time has the same format as
                                                  offset except that no leading
                                                  sign ("-" or "+") is allowed.
                                                  The default, if time is not
                                                  given, is 02:00:00.

                                       While the STD field and the offset field
                                       for STD must be specified, if the DST
                                       field is also provided, the system will
                                       supply default values for other fields
                                       not specified.  These default values
                                       come from file /usr/lib/tztab (see
                                       tztab(4)), and, in general, reflect the
                                       various historical dates for start and
                                       end of summer time.

Hi everyone,

i hope that someone can help me in this matter:
```

In my time as an ST-User, I did a program in OMICRON BASIC (which was delivered with the 1040 ST for a certain time) In the manual, a compiler is mentioned, but it was too expensive for me at that time...

Now, as PACIFIST and all the other emulators emerge, I'd like to make the compiled program available on the net, but first I need the compiler !

Does ANYBODY know something about it ???

Please, as I do not read the newsgroups often,
MAIL your answers to: daegest@fh-trier.de !!!

THANX ALL YOU ST-GUYS !

I wrote a program to do this a long time ago. You can put it in your AUTO folder and it switches the clock of your computer to daylight saving time and vice versa automatically.

It used to be on cnam.fr, Utilities/Clocks/dstint.lzh, but I don't know if that ftp site still works.

I can also mail it to anyone interested. Please indicate if you want uue or base64 (MIME).

  gary@the-gap.demon.co.uk (Gary Priest) said:-

>The Supported DOS software will also change automatically if the 'GTZ'
>environment variable is set correctly to:
>
>   GTZ=GMT0BST1,M3.5.0/01:00,M10.5.0/02:00

    It can be TZ (and not GTZ) if all used software recognise the extended syntax. If some programs don't and get confused, you can set a simpler TZ=GMT0BST for them, and a complete GTZ for the others. A modern app should getenv("GTZ"), and if there is not then getenv("TZ") to read the timezone informations.

    BTW AFAIK this syntax is not a DOS stuff, but a Un*x one, also used by some DOS, TOS, MiNT or others applications. And there is a problem with the values you have given for Great Britain, the "1" just after "BST" should be a "-1" (or nothing at all).

    Here in France (and most central Europe countries) it should be something like "TZ=MET-01:00MEST-02:00,M3.5.0/02:00,M10.5.0/03:00". The values are: std offset[dst[offset][,StartRule[/time],EndRule[/time]]]

 - std (MET here) is the standard timezone name (for winter time).

- offset (-01:00) is the value to add to local time to get GMT. You can omit leading zeroes, omit minutes or add seconds (-1 and -01:00:00 is the same offset). For positive values you can set a "+" in front or not.
- dst (MEST) is the summer timezone name. If it's "DST" the name will be "MET DST". If there is no name, there is no summer time.
- offset (-02:00) is the same as the first offset but for summer time. If it's omited it's automatically one hour ahead of standard time, just like nearly everywhere AFAIK.

The transition rules now: the first one is the to-summer rule, the second to-winter. If a rule begins by an M (as in "M10.5.0") the 3 numbers are the month (10=October), the week (5=always last), and the day (0=Sunday). The time is in current local time, so it's in standard time for the to-summer transition rule, and in summer time for the to-winter rule.

So the above french TZ values means zone named MET in winter, and named MEST in summer from last Sunday of March at 2:00 MET (1:00 GMT) to last Sunday of October at 3:00 MEST (1:00 GMT).

A good Great Britain TZ value could be "GMT0BST,M3.5.0/1,M10.5.0/2" I think, for USA Pacific time "PST8PDT,M4.1.0/02:00,M10.5.0/02:00", for New Zealand "NZST-12NZDT,M10.1.0/2,M3.3.0/3", and for Newfoundland "NST3:30NDT1:30" (I don't know the transition dates).

This environment variable should be read and parsed by the time library of your compiler, but some don't do it like Pure C for example... It is used to get time(), calculate localtime() and gmtime(), etc... from a system clock always in local time. It doesn't change the system clock.

To change automagically the system clock when it is needed at the correct date, there is a really nice little AUTO program called DSTINT 1.4 by Jos den Bekker. It has just worked here yesterday to correct my clock when I powered on my Falcon, I didn't need to do anything by hand... It was at ftp.cnam.fr, should be at ftp.lip6.fr, but AFAIR Jos never uploaded the last revision.

Bye! Bruno.

Not to be-labor the networking thing... but I was wondering if anyone knew of a
networking package that:

1. Runs on both Falcons and Mega STe's
2. Actually uses the LAN port instead of the MIDI port

Anyone?

A serial or parallel will suffice I suppose, but MIDI is out because my Falcon
is used or D2D and MIDI...!

There is a German package callled MidiCom which will allow you to
network upto seven Atari computers via either the MIDI, Serial or
LAN Ports.

System Solutions is the UK supplier for MidiCom. There is also a
German demo version which allows you to network your Atari's, but
only allows you to share drives A & C. You can find this demo on

many Atari FTP Sites.

Regards,

Ben Hills.

MiNT-Net. It'll require a reasonable amount of RAM though, so the Mega might
struggle - 4mb is enough though.

> 2. Actually uses the LAN port instead of the MIDI port

AIUI (yes, I haven't tried it), MiNTnet will support the LAN port - it is after
all it is simply another serial port (at different speeds, of course).

> A serial or parallel will suffice I suppose, but MIDI is out

MiNTnet supports RS232, parallel and MIDI as well.

Anthony

Hi everyone,

I'm running "D110 manager" on my Falcon, but I have some problems with
the screen io. 'think this is because the program is written for an
atari st.

Does anyone know of a newer version of the program? (mine says (C) '89)
or any other solution to get it working?
(I tried backwards III but it doesn't help).

greetz,
Vince

ps problem is that after file select box has appeared the screen behind
the file selector isn't redrawn c.q. unreadable, so I can't do any disk
operations.

You can use STinG to run a network with LAN ports. It however is only used
for connecting two machines, to add others you'd need to use other ports
too. The Mac-like bus structure LAN isn't available with STinG.

Cheers Peter

I want to pass parameters in registers to a routine written in assembly. As far as I can make out from the (execrable) manual the format should be: extern void __asm getmove(register __d7 int, register __d6 int, register __a5 long, register __a3 long); among the declarations, then getmove(oxy, routecnt, wallf, fightf); where it's called. This apparently compiles if I set rb in the Compiler options, but Clink says Not a valid object file. And it took a lot of experiment to get it compiled. What am I still doing wrong? I am already linking in an assembly o-file, and I probably could have made a workaround envelope routine in a few minutes, but I want to use the __asm facility; it might be useful elsewhere. Please respond by email, as I wouldn't be using DejaNews for posting if I had any confidence in my ISPs Regards Brian O'Donnell odonnllb@indigo.ie odonnllb@tcd.ie Both adresses work; both news servers suck

I was wondering if Clayton Walnum is still involved into
'C' programming on the Atari platform?

He authored a really good series on 'C' programming for the
Atari platform is ST-Log, in the early 90's and eventually
compiled it all into a book called "Cmanship Complete".

While his book is now somewhat outdated (in regards to any
multi-tasking considerations) this is still THE book about
programming in 'C' for the Atari ST/TT/Falcon.

What could/should be done is an HTML version on CD-Rom, to
help those just getting started into programming their ST;
the same thing that was done for The Atari Compendium some
2 years ago.

However, first, we have to find the man himself for proper
authorizations and, if he's so inclined, to update the info
contained in his book.

Clayton, if you are reading this, please respond! ;-)

> NO BUG ON AMIGA!!! :))

Yes, but by the way , did you forget
original Amigas have NO RTC Chip ;-))
You should say "no chip=no bug" ;-)
Anyway the bugs won't come from the

hard nor the system, but rather from the
software apps, when caculating about date
difference ,for example !

Anybody interested in contacting Clayton could drop by his web page at:

http://www.connix.com/~cwalnum/

Or email him:

cwalnum@connix.com

It seems he wrote a further three books on Atari programming:
The ST Assembly Language Workshop
AES Quick Reference
VDI Quick Reference

All of these and Cmanship were self-published in the States. If he were
to authorise a public domain version of his works, I would personally
favour an ST Guide version or at least an HTML version distributed over
the net or by floppy as I don't have a CD ROM drive :-(

Is it possible to make a routine (I hope in C) to play a digital sound,
like .SND, during the execution of my game WITHOUT to stop it until the
sound is finished ? (like the standard Dosound() function, but best quality)

I just tryed with a routine to play .WAV files but I must wait the end
of the WAV file...

Have you some methods, routines, examples, documentations or others things
to show me ?

Thank you very much!

What machine?

STE, TT, Falcon - easy. (for Falcon details, check my WWW pages).

STfm, not so easy, but possible... it'll require linking with an assembly
routine which will install itself on interupt (allowing execution to continue,
but slowly).

Anthony

There was also The ST Assembly Language Workshop - Vol. 2 which was
distributed as shareware. It wasn't printed. When I registered mine
Clayton sent a note saying that I was only the 5th person to register.
This was about 3-4 years ago, hopefully he got more registrations.

It's only possible on a machine with a DMA sound system, eg TT, STE of
Falcon. On other machine, it's also possible but you have to build
interrupt-routine that slow-down the machine and that can be only done
in assembly langage.
In C, using the DMA sound system, you just have to laod the digit, set
correctly the sound system, then send it the adress of the sound and its

lenght and the system will play the sound itself.

Regards

The best way is to use the DMA sounds capability built into the newer machines (since the STE). Also, you can use SAM (System Audio Manager) which makes the process even easier, and also allows the possibility that the software might work on other machines that don't have DMA sound, if a version of SAM was made to support the sound capabilities of those machines. Use waveplay() to play sounds with SAM.

The Atari Compendium is a good place to look for further information - there you can find details of waveplay() and the DMA sound.

Yes, I have a TT030 (DMA sound system)
My problem is understand if this method can play the digit without froze
the system... (in playback)

Yeah, when I registered, the note he added on the receipt made it sound like
he hadn't had much of a response. A real shame, as it was those two
Assembly Language Workshops which got me programming GEM assembly programs.

Does anyone know if James Cox is (still) reachable by Email or reading this newsgroup (in which case: Hi :)
I have a question regarding his wonderful Component Manager, which I can't use because he forgot to include some info on how to use the component loading utility. I don't know

the format of the command files it uses.

For anyone who doesn't know what I'm talking about:
The component manager is a small MiNT program (about 4k)
which enables Atari users and programmers to make use of
dynamically loadable components (similar to DLL's, Dynamically
Linkable Library's).

I've written a GEM ui extension component
(more on that later, when I've finished debugging & testing the thing)
to go with an art program I'm working on, but I can't test it because I
can't load the damn component.

Hello again,

I'm going to really start publicing ICTARI properly now.

For those who don't know, ICTARI is a disk-zine / user group
for Atari programmers. You can read, download and contribute
to the zine on the WEB:

http://www.elis.demon.co.uk/ictari/ictari.htm

If you know any keen programmers not on the 'net, I'd be
grateful if you could print this out and give them a copy.
Why not take it to your local user group meeting ?

Thanks,
"Augeas"

```

possible) so that other members can hopefully provide a soloution for you.

We trust that you will consider becoming a member of the group and provide some useful input to the magazine occaisionally. If you are interested perhaps you would fill in and return the enclosed questionnaire to us at the above address. To recieve the next issue you will also need to send a double sided disk together with two 2nd class stamps or 75p cash for each month. Please return these as soon as possible so that we can place you on our mailing list for the next issue which will be despatched about the 15th of the month. The questionnaire and latest issues are also available from the ICTARI WEB page. Cheques or postal orders should be made payable to Mr G. R. Greenway. Back issues are also available for 1UKP each.

If you decide not to become a member we would be grateful if you would pass this letter and questionnaire on to someone who may be interested.

We hope that you will agree to join the group, we are sure you will find something of interest on each disk and for just a few pence a month can you afford to miss out on the chance ? We look forward to hearing from you in the near future.

Issue 50 of ICTARI, the disk-zine for Atari programmers can now be found at the usual place:

http://www.elis.demon.co.uk/ictari/ictari.htm

That is all.

Have Fun,
"Augeas"

(Sorry it took a time...)

Why do you think is that sound system called a *DMA* sound system ?

Cheers Peter

Well if someone could talk him into releasing all those books in one
form
or another it would be cool. Those AES and VDI books wouldn't be to bad
either. Also a CD-ROM version with both a html version and the original
version for printing out on paper your self would be cool. A good reason
to finaly get that CD-ROM!

The DMA doesn't use the processor. So the playing of a sound with DMA is
totally transparent for the system, it don't freeze it.

Hi,

I would like to know if there is a __clean__ way
to setup serial parameters (esp. length and parity)
in a way that is independant of the hardware ?

I suppose that the XBIOS 0x0F call support only the MFP
so it won't work with the ST's 8530....

It should also be compatible with HSMODEM and others
hi-speeders.

Thanks for any pointers.

Sincerely,
Jean-Michel MERCIER.

Looking over my hardware docs, I see that Modem 2 uses a 2.4576 MHz
clock (RTxCB), and that Serial 2 uses a 3.672 MHz clock (RTxCA) .
In clock mode 16 (asynchronous) this gives the following baud rates:

TC	Modem 2	Serial 2
0	38.4 K	57.4 K
1	25.6 K	38.25 K
2	19.2 K	28.7 K

It is also possible to use PCLK (8 MHz):

TC	Baud
0	125 K
2	62.5 K
3	50 K
6	31.35 K
8	25 K

However, these do not correspond to the figures I've seen here
(presumably from HSModem). Am I missing something, or is it that
one need not match baud rates precisely?

AFAIK, the old version where the patch works is a non-BFD based linker.

I am working on BFD support for Atari ST binaries, but this may take some
time ...

You don't need to mess with clock rates. Disconnect pin-32 (RTxCB) from the circuit-board and solder a short wire to pin-13 (RTxCA). This will allow Modem-2 to use 57600, 115200 and 230400.

You then need to change a parameter in HS-Modem's SCC.PRG config to have it provide the new baudrates. (HS-Modem assumes what are the "normal" baudrates using the TOS version)

Afaik, the TT is the only SCC machine with non-standard baudrates on Modem-2. Both the MEGA-STE and Falcon have 57600 and 115200.

However, the unusual baudrates are not such a dumb choice. Read texts on "The TT030 Homepage" at my URL to learn more about these.

Yours,

You need to Fopen the port (Fopen ("U:/DEV/MODEM2", FO_RW); turn the slashes into double backslashes in C), then use Fcntl to modify the parameters. Use their corresponding filenames in DEV for the other ports.

With neither HSMODEM, nor MiNT, nor MagiC there is no unified way to set all the parameters for all the interfaces. For some parameters, you can use Bconmap to map the port to AUX:, then use Rsconf, but that only works with TOS 2.0 or higher.

> I suppose that the XBIOS 0x0F call support only the MFP
> so it won't work with the ST's 8530....

There is no ST with 8530 (unless you've put one in). It's used only in the Mega STE series, the TTs, and the Falcons.

But the XBios 0x0F (Rsconf) does work with those too, if you mapped the 8530 port to AUX:. Note not all of the Rsconf parameters are valid in that case.

Generally I strongly advocate to not use such code in a user application. Such setup stuff is the task of specialised tools, like the MODEM.CPX or SERIAL.CPX. Note my SERIAL.CPX supports all the HSMODEM features. So I'd suggest to not care about the settings in your program code, and simply use those the user has chosen with the CPX before running your software. It

will save you a lot of work, and removes lots of opportunities to spoil
compatibility with other machines.

If you wanna provide a complete package to the end user, pack the SERIAL.CPX
into the archive that you distribute.

Cheers Peter

OK, I understand...
Finally I developed a little C routine: good result!

Another thing: in the Atari Compendium book there is a waveplay() function
to use with the SAM (System Audio Manager) by Atari.
OK...!
But WHAT IS ?

> But WHAT IS ?

What is SAM? well, its a program which Atari wrote which allows you to attach sampled sounds to system events (such as windows closing, crashes etc). This works on all DMA sound based machines with TOS 2 or greater. It supports 16-bit on the Falcon.

SAM also allows programmers to register their programs as "SAM Aware Applications" via .SAA files, allowing them to play user-defined sounds which are assigned through the same interface as SAM's system sounds - to create a .SAA file, us KP SACK, available from my WWW pages.

The final piece of functionality that SAM provides is the plain Waveplay() function, which provides a simple interface to playing samples, useful for application programmers who do not wish to fiddle with the DMA registers themselves.

References:
  http://www.zetnet.co.uk/jacquesa/kpp/kp_sack.html
http://www.zetnet.co.uk/jacquesa/programming/waveplay.html

note: the text on the KP SACK page seems to be out of date - SACK 1.0 has been released for a while, as has the patched version of SAM (1.3) - both of which are linked to at the bottom of the page.

It work fine with every kind of serial interface because
the driver should emulated the mfp parameters to setup
the serial port.

> It should also be compatible with HSMODEM and others
> hi-speeders.

HSMODEM install all what you want to setup serial port
and he has some documentations to explain it.

Jaques, I'm sorry but I think these urls are not working..
I've been wanting to check for updates for some time now since I lost
your code for dma playing and wanted to try to get to dma play with the
external clock.

I can't see how it can setup anything else than the original
MFP port as there is no parameter to select which port you
want to setup ...

Yes,

I found the U:\DEV\portname and Fcntl tricks and ported them
to GFA [if anyone is interrested...]

By the way, the U:\DEV\... path exist in TOS or is it a HSMODEM
add-on ?

I've been meaning to update the info in the DMA playing routines, but
I haven't gotten around to it...

Hello everyone,

Yesterday I finally succeeded to install GNU 2.7.2 on my falcon.
Unfortunately, with test compiles of C++ the linker seemed to have
problems with handling exceptions.

Anyone can help me out with this? Do I need other libs for this than the
G++.olb?

greetz,
Vince

Hi everybody !

Finally, here it is ...

    Running is released.

This means that this mailing list has lost his intention and will be deleted right after sending this last message.

Well, we have broken a lot of promises and deadlines ... a lot of people thought we would never release this game. But the RDT team never thought of canceling the project and succeeded to create an outstanding game for the ATARI Falcon computer system.

For further information and some screenshots please visit our page at:
    http://stio1.fh-wuerzburg.de/student/i381

For other questions, please email to:

kx0029@kulmbach.baynet.de RDT HQs
i381@stio1.fh-wuerzburg.de Public relations HQs

We think that we have done the best we can. Now it is time for the

ATARI Falcon community to show their respect and fairness and spend some money in buying this great game. We spent a LOT OF TIME and MONEY to get things right - support us and don't be a pirate !!!

The prices are very modest, and there are several distribution partners providing support and easing the ordering procedure for you. Please carefully read the next lines ...

---------- Distribution in Germany ----------

Deutschland. Running kostet im Deutschlandvertrieb 59 DM. Bestellungen k□nnen schriftlich oder per Email get□tigt werden.

Schriftlich bei:

RDT Volker Konrad
Georg-Thiel-Str. 13
D-95326 Kulmbach

Bei der Bezahlung ist dabei m□glich:
- Vorkasse 59 DM(auch m□glich: 60 DM - die Differenz von 1 DM liegt der Bestellung sp□ter bei).
- Eurocheque □ber 59 DM.
- Bank□berweisung von 59 DM an:
  RDT Volker Konrad
  Sparkasse Kulmbach
  BLZ 771 500 00
  Kontonummer 810655

  Bitte □berweisungsquittung (mit Tagesstempel der Bank) mitschicken (oder Kopie), ansonsten warten wir die Gutschrift ab.
- Per Nachnahme. 59 DM + 3 DM f□r Postzustellung per Nachnahme.

Email an:

kx0029@kulmbach.baynet.de

Hier ist nur m□glich:

- Per Nachnahme. 59 DM + 3 DM f□r Postzustellung per Nachnahme.

---------- Distribution in the UK ----------

UK. In the UK Running is available for 20 UKP + p&p. Mailorder at:

Denesh Bhabuta
CyberSTrider
PO Box 2023
Wickford
SS12 9RX, UK

Some ways of payment:
- Eurocheque
- Cash in Pounds Sterling, Dollars and DM.
- International money order payable in *Pounds Sterling*

For further details please visit Denesh's homepage at:
http://www.cyberstrider.org

or send him an email:
denesh@cyberstrider.org

---------- Distribution in Australia/Newzealand ----------

Australia and New Zealand. Running is available for A$ 50 + A$ 5 p&p.

Order Running at:

Anthony Green
Fujination
GPO Box 1190
Hobart TAS 7001
Australia

For details please visit Anthony's homepage at:
http://www.intelitec.com.au/fujination/

or send him an email:
ac_green@tassie.net.au

---------- Distribution in France ----------

In France Running is available soon.
The negotiations are still running and hopefully will be finished next week. Please visit our homepage (see above) about the news.

---------- Distribution in the USA ----------

Our partner didn't answer for some weeks. We hope he will get online again soon.

------- Distribution for all other euorpean countries --------

Europe. Please order via postal mail at:

RDT Volker Konrad
Georg-Thiel-Str. 13
D-95326 Kulmbach
Germany

And about the prices:
- Cash 65 DM - use registered letter !
- Cash $ 40 - use registered letter !
- Eurocheque, Value 65 DM.
- European money order, value 65 DM.

Important: you have to takeover all banking transaction fees!

------- Distribution for all other countries worldwide --------

Rest of the world. Please order via postal mail at:

RDT Volker Konrad
Georg-Thiel-Str. 13
D-95326 Kulmbach
Germany

And about the prices:
- Cash 70 DM - use registered letter !
- Cash $ 45 - use registered letter !
- Eurocheque, Value 70 DM.
- International money order, value 70 DM.

Important: you have to takeover all banking transaction fees!

---------- End of distribution information ----------

Some people asked us to release a multiplayer version or to release our level editor.
We are willing to deliver a multiplayer version with some special levels. However, this depends on your feedback, i.e. the Running sales. We think that we don't have to give you all at once. We have done our part - now it's your time to motivate us again.
The level editor runs under Windows95/NT - this reduces the interest for all ATARI users, we think. But if there is still interest in the editor, we probably release it ...

Ok, time to say goodbye and hopefully welcome you as our customer soon.

Have fun with Running - it's great.

Yours,
RDT team, 1997.

 I have to admit that I thought it was a no goer... I am so pleased to
be proved wrong....and I havn't got a Falcon, just a healthy interest
in the ATARI Games scene :)

 That just leaves Bad Mood and Willes Adventures :))))))

How can you write an Atari game. Is it like writing a CD? I am a programmer with an Atari (ancient though). Is there a kart that lets you program other karts?

First, are there any problems using GFA basic with Magic or Geneva? If so, what and can they be easily solved?

Second, what are the advantages/disadvantages of using Magic and Geneva?

Third, is Geneva still available and, if it is, where from?

Regards,
David E-Mail :- dbolt@my-ste.demon.co.uk

Hi Dave,

I think I have the 68000 codes in a file on my Amiga. Will have a dig
around and send them to you, here. Give me a couple of days mate....

Here I try again to find somebody who can help finding a PureC 1.1 of 22 Gen 1993 (not 1992):

I've found on a BBS:

```
PD_PATCH.ZIP   76k [1] V1.01 des Patchprogramm f►r den PureDebugger. Er
behebt                     Probleme die haupts►chlich unter Multitasking
                   auftreten, benutzt XBRA, TT-RAM als Grafikspeicher, Esc H
                   Ausgabe kann abgestellt werden. Au►erdem kann eine
                   2-Monotorversion erstellt werden. Alles incl. Quellcodes
                   in C und Assembler (Pure C/Pure Assembler)
```

And in a file of this archive:

```
/*            Patch_PD
        (c) 1997 by Dimitri Junker
            Adenauerallee 30
            52066 Aachen    */

/* Meine Version -> allgemein: f_name; EdDI_1_1;vq_extnd;    */
```

I would like to contact this author by email, as I do not understand German.

I would really like to set up a PureC-Debugger environment on my system with MagiC and the Crazy Dots2 NVDI ET4000, this seems possible, but I can't understand enough, can anybody help me ?

I cannot compile the program for v1.1 of 1992, libraries and headers missing.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

HI!!

I've written an RTF to HTML converter using ANSI C standard libraries, it's freeware for various computers, but I want to make an ST version for Marcel users. So, if I send someone the source code, can they compile it in Atari ST C (pref.68000 code), and send me the object code? I'll give you full credit for it, and post the object file on Atari.Binaries and my Webpage.

Thanks.

I still have a few hardware bugs to sort out.

One of these is the 'wavy' lines that appear when the mouse is moved onto the
menu bar & a new drop down menu appears.Some screen pixels are getting
corrupted.

This happens to a lesser extent when a window is redrawn.I don't have a
blitter installed.

Is the VDI copy operation particularly fast, or does it have some special way
of reading/writing to memory?

>> I expected it would be available

>you could probably write a hack to prevent it from doing so, but why
>bother?

I was hoping to use this memory only for programs, I recently installed
MiNTnet & find the lack of memory a problem. I was hoping to use the new
memory for daemons & drivers, leaving the ST ram for programs that need it.

Until I solve the screen corruption, the new memory is of limited use.

One thing I did find strange is that a program called RAMTEST finds many errors in the new 4 Mbyte block, while my own memory testing routines do not.

Anybody familiar with the program RAMTEST?

Sysinfo reports a weird memory configuration, ie.

```
8192              Kbytes of ST RAM
3910346         bytes of Free ST RAM
0                   bytes of TTRAM
4104657         bytes of Free TT RAM
8015003         bytes of used ST & TT RAM
Total ST & TT RAM        8192 Kbytes.
```

I don't know of any way to tell the ST that the memory above $400000 is alt ram, does it know this already? Is there some location, like the MMU configuration register that the OS reads for alt ram?

Does anyone know why the STOS compiler comes up with a file error when compiling files on the Pacifist Emulator 0.46?
Any help much appreciated
Andy

> Does anyone know why the STOS compiler comes up with a file error when
> compiling files on the Pacifist Emulator 0.46?

Things that frequently cause "file error"s...

1) Corrupt files in \compiler\
2) With PaCifiST 0.45, STOS worked better from a disk image - try this.
3) Too many files on the "drive" - STOS seems to have a limit on the number of files on the partition that it is run from. If you are mounting your entire PC's hard-disk, try a smaller subset of the drive. (I have witnessed this error on my Falcon).
4) What version of the compiler are you using? If it is my beta 3 then download the beta 2 as several major bugs were introduced (including one which sometimes generates file errors). Hopefully a fixed beta 4 will be ready soon...

If this doesn't help, mail me and I'll see what I can do.

Anthony

Could you please describe how these "wavy" lines look like?. I had a similar
problem due to a ground loop that made the GLUE produce wrong video timing.

Are some memory positions corrupted? In that case I would suspect EMI
or faulty soldering/ground.

There are some Alt ram related system variables. Have you set them
correctly?

If you use MiNT the most easy solution would be to alter the mint kernel
since it handle all M(x)alloc's itself. Otherwise you can setup the
Alt-ram related system variables using a small auto folder program.

It definitly appears to be screen related, perhaps when the OS is moving things around the screen.

>Are some memory positions corrupted? In that case I would suspect EMI

When the memory is tested on its own, there appears to be no problems.

All I have done is to use 'Maddalt' to tell the system about the memory.

I don't know about any other variables, do you have specific information?

I am concerned the OS thinks the new memory is ST ram & is trying to access it like memory below the 4 Mbyte limit. Is the vdi copy process different from other memory operations?

An Auto folder prograqm sounds like the best way to go.

I have written a Neochrome screen to Windows BMP converter for the ST. It was written in STOS.

If anyone is interested I can send ST executables or STOS source code.

I am working on a STOS compressed screen to BMP converter, and a STOS Sprite to BMP converter too.

This is a little complicated problem on Atari's unfortunetely. I don't have a C example, but I'll try to explain how it's done.

The hardware register $fffc02 gives a scancode for a key when it's pressed down and another code (scancode OR'd with $80) when the key is released. So, what you need to do, is to have saved in a small buffer which keys are pressed down, when you get a "keypress" code, and then remove the key from the buffer when you recieve a "keyrelease" code for that key. This works with two keys at the same time, but not more due to restrictions in the keyboard processor.

Another common solution to the problem is to use Shift keys, Alternate or Control for fire. These keys are handled in a different way by the

keyboard processor, and it is therefore possible to have shift pressed
together with another key.

Hope it helped a little. :)

Greetings,

Tomas

Yes please, do help! ;)

I'm doing a little at a time, since I don't have that much time now
when studying. That means I haven't stopped programming on it, it's
just going a little/much slower right now.

Sources for encoding has been very hard to find for a long time, but here is where you can get them:

ftp://ftp.tnt.uni-hannover.de/pub/MPEG/audio/mpeg2/software/technical_report/

I haven't tried to compile them on Atari, and I don't think I want to. My brother says it is MUCH slower than the shareware, binary-only l3enc that is available for some platforms, obviously not Atari.

In my conversion into DSP assembler, I use "amp" as base. It's C sources and is compilable in Linux on my Falcon, but of course there's no chance of realtime playing with it there. You can find amp and some other free players through http://www.mpeg3.com along with a bunch of other info.

Greetings,

Tomas

The video base is still in ST ram, but the buffer the OS uses for drop down
menu's is in Alt ram.

I tried using the 'rdisc_tt.ttp' program; I hoped I could sieze all of the alt
ram before the OS took some away, but the ram disk program was not able to
find the Alt Ram.

Do you use 2.06 or MagiC? Both handles "TT-ram" without problems, "lesser" versions doesn't. With 2.06/MagiC and upwards it should (atleast in theory) be sufficient to register the new memory with Maddalt().

Perhaps you need to set some system-variables as well, but I really doubt that.

Hey everyone,

I'm trying to send codes to a printer, such as text styles, line spaceing, initialization e.t.c. However when sending the codes to the printer Via LPRINT it prints what I'm sending or at least some of it, and does not set the configuration.

Example:

Esc command for double strike mode on an epson printer is ESC G with decimal 71.

```
Double.strike.on$=chr$(27)+"G"+chr$(71)
LPRINT double.strike.on$
```

Once this is sent the printer prints G and nothing changes. Does anyone know how to send esc codes to the printer in string format. I can use the OUT command with varibles but it gets very lengthy, especially

when sending many codes with ,'s seperating them. Anyhow I'm doing this in GFA BASIC. Any advice on how to do this would be greatly appreciated.

Scott.

Hou... I've done that a few years ago in an arcade GAME and I was
driving 4 keys at the same time. I think that it will be more easilly in
ASM that in C. In fact one of the main problem with that (key and
joystick) is that if you put your routine in hardware (eg $118) you will
disabled your debugger. So try to find other vector (using Iorec and
Kbdvbase).

Good Luck

I am using TOS 2.06 & I just have small program that uses Maddalt() to
register the new memory. When I look at the memory descriptor blocks
afterwards, I can see the new memory & the chunk the OS has grabbed for
itself.
>
>Perhaps you need to set some system-variables as well, but I really doubt that.

I think you are correct, I am not able to find any documentation about what the variables are or might be.

TT owners may be able to help here, the TT's Ram can be both ST & TT.
The ST memory configuration is written to a location in memory, the value of which is dependant on the memory found at startup.

How does the TT record the value for TT Ram?

I have looked at the file which gives the Atari registers for all of the machines & there is no memory configuration for the TT in the file.

There is for the ST, but surely this cannot work for both machines.

How do the machines distinguish between ST & TT Ram?

Is it automatically given that any Alt Ram must be TT Ram by definition & the OS ensures that DMA access cannot take place?

I now feel that I would be better off having 8 Mbyte of ST Ram, at least this would mean the screen would be at 7F8000 & all the memory would be in one block.

Doing this is not easy, however.

LPRINT doesn't work properly in GFABASIC. Instead, try writing to the file PRN: or LST: (I don't remember exactly which one of the two is the right one)

```
open "O",#1,"LST:"
print #1, doublestrikeon$
```

close #1

That might work better.

AFAIK printers will not send "property" codes. Nor will they send
"status" for bad codes.

This means that printer properties are always registered manually
somewhere i.e. in a program's "inf" file or in a devices property
record (for GDOS or NVDI).

It's a good point though. Why WON'T printers tell us what they
look/feel like??

HOW TO ATTRACT GIRLS INSTANTLY....Secrets to instant sex appeal

PURE INSTINCT PHEROMONE ATTRACTANT FOR MEN
WILL GIVE YOU AN UNFAIR ADVANTAGE WITH WOMEN
GUARANTEED

(or your money back)!

Everyone knows that some men (a tiny minority) are able to instantly attract women. It used to be known as "animal magnetism". Scientists now say this natural attraction is due to pheromones - body smells that are not consciously detected, but that effect the behavior of others towards the person giving off these chemical signals. It's natures way of attracting the opposite sex. Scientists have now isolated and synthesized two natural Attractants- androstenol and androstenone pheromone. Carefully controlled experiments show they work and have been widely reported on television and in both the British and international press. Androstenone pheromone has been successfully tested on BBC TV's "TOMORROWS WORLD" and by Desmond Morris (Author of "The Naked Ape" and "Manwatching" and renowned human behaviorist) on BBC TV's "Friday Night... Saturday Morning."

New improved formula PURE INSTINCT from ICT Research Technology contains

both ANDROSTENOL and ANDROSTENONE pheromone and produces and undetectable scent that subconsciously attracts women to the wearer. PURE INSTINCT is the world's number one selling and the most concentrated (5 - 7 x normal active strength) pheromone spray for men - don't be misled by cheaper (or more expensive) imitations.

WHAT THE PRESS SAY:

* Lowell Ponte, a former consultant on exotic weapons and a Readers Digest science writer, said in an interview that "use of the recently discovered chemical Androstenone should be banned. Congress should pass a law making it a crime to use this chemical to influence voters by making politicians appear more lovable.
- The San Francisco Chronicle -

* "The stuff attracts women like you wouldn't believe"
- Colorado Telegraph

* "And now this pheromone has been marketed, we've tested it - and good grief it works"
- Koave

* "pheromones influence human behavior in a subtle way. Women are attracted to the smell"
- The Daily Telegraph

* "Pure Instinct is likely to produce a state of sexual excitement or arousal"
- Men Only (Vol. #44 No. 4)

Much of our sales of PURE INSTINCT are reorders from existing users, reports confirm success. "PURE INSTINCT really does seem to work! The most dramatic instances have occurred when wearing it at discos. Girls just drift towards me and start flirting."
-DT Cardiff

"I Knew PURE INSTINCT wasn't a gimmick when one of the girls at work, quite out of character, started to seduce me when we were alone in the office."
-SD Nottingham

PURE INSTINCT comes in a discreet 15ml pocket roll on container with full instructions, Ideal for any man who wants to join that lucky few who have more than their fair share of sex appeal.

30 DAY MONEY BACK GUARANTEE

If you are not 100% delighted with the results from using PURE INSTINCT simply return remainder within 30 days for a full refund- No questions asked!

Subject: OberonV4 beta for Atari-ST available
Date: 1997/10/11
Message-ID: <1997Oct11.100803.47627@yogi.urz.unibas.ch>#1/1
X-Deja-AN: 279436778
Organization: University of Basel, Switzerland
Newsgroups: comp.sys.atari.programmer

A new release of ETH Oberon System V4 for Atari ST & TT computers is
now available. Oberon is a programming language together with a complete
operating system, developped at ETH Zuerich by Nicklaus Wirth, the inventor of
pascal and modula-2. For more info about Oberon have a look at
http://www.math.tau.ac.il/~guy/Oberon/

The release can be downloaded at ftp.inf.ethz.ch in the folder
pub/Oberon/OberonV4/AtariST

The system is supplied with an Oberon(-1) compiler, a linker and
comes with complete source code. Please remeber that the Compiler does not
support all Oberon-2 features, to wich some of the documentation is referring
to.

ST-Oberon has been tested on TOS 1.0 and 1.4 on a 1040STF, a MEGA ST2
and a Stacy. It may be that the current version of Oberon won't run
on the newer TOS versions, since it uses some system variables, and
modifies the exeption vectors.

Hardware Requirements:

Atari ST or TT computer with at least

2 MB RAM (for serious use, altough ST-Oberon will also run with
 only 1 MB)

4 MB of harddisk space, preferably on a harddisk connected to the

ACSI port.

have fun!

please send bug reports or feedback to eglis@ubaclu.unibas.ch
under the subject "stoberon".

Well, I must say I had an excellent response from this newsgroup. Thanks, everyone!! It's compiled now, however, so you don't need to reply anymore!! (I just don't want to waste anyone's time...)

As for the compiled program itself, if anyone wants to get hold of it, I'll post it on de.alt.binaries.tos, assuming that's actually for the Atari, and not something... unsavoury. I'll also upload it to FTP sites when I can work out how to, and put it on my Webpage (address below)

If anyone wants the RTF to HTML, or HTML to RTF source code, then feel free to E-Mail me for it. I'll wait a week or so until I've got enough responses, and then send it all off as one message (to cut phone costs 8-(

Thanks again,

Jeremy Smith.

To reply by Email, reverse the first bit.

The only difference is the STFM has a TV Signal _M_odulator so you can
use the machine on your TV. Otherwise, it's the same machine. (Please
keep in mind I'm in the U.S.... YMMV and all that jazz.)

>Once this is sent the printer prints G and nothing changes.
```

It's "ESC G G" you send... The correct code for double strike is simply "ESC G" (and "ESC H" to go back to single strike). So it's normal you get a double striked single G letter on the paper. Better use:

```
Double.strike.on$=chr$(27)+"G"
```

```
>Any advice on how to do this would be greatly appreciated.
```

Could be declared as a function too, something like:

```
DEFFN doublestrike$(on!)=CHR$(27)+CHR$(ASC("H")+on!)
LPRINT @doublestrike$(1);"You know what? I'm happy.";@doublestrike$(0)
```

Bye! Bruno.

Thats not a very portable solution though - they clearly say that they want
it to work on all Atari machines, and VSetScreen (setscreen with res= 3)
is a Falcon call...

This is absurd! I have two TT's, and have been trying to
rearrange them so I can give one to my daughter. A couple of nights ago,
I posted about my floppies "disappearing" on one of them. Under thing,
when clicked on a floppy, or typing alt-A, which should open it, it just
dings. Under the desktop, I get a message

Device A: does not exist

And then after making the post to CSAS, and playing with the SCSI port,
un-plugging and then plugging in my ZIP drive, it started working.
Tonight, I swappped memory between them, (one had 4+4, and the other

10+16, both Atari boards) and now the other computer has the floppy locked out!!! Is there a virus that does this shit? Has anyone ever heard of this?
    If I try cold booting for a floppy, the light doesn't even go on.
It's not power shortage, cause the second TT is in a tower case, with a separate, large power supply. UI am going wild, trying to figure it out.

Can anyone help? Has anyone encountered this before?
CPX's that look at the disks don't see it. It makes no sense to me.

    HELP!!!

I've ordered CAB2.5 inc. PPP Connect from System Solutions and should hopefully get it in a couple of weeks.

I might be interested in modifying POPwatch to use PPP Connect (as well as STiK etc.). To do this I obviously need programming docs for PPP Connect.

Does anyone know if these are publicly available? If so, where I can get them? I guess they'll be in German which is going to be a pain :(

Cheers,
Gary

Hi,

Welcome me to this group, its the first time that I posted.

I'm trying to write a simple game demo for the Atari STe utilizing both the blitter chip and the joystick.

My blitter routines work fine. It's the joystick part thats messing up. I'm using keyboard command $14, which seems like the accepted conventional way of doing it. It seems to work fine, until I place the joystick routines in a loop with my blitter routines. Then command $14 likes to place $ff into the buffer for the joystick input. This makes the control spotty at best.

BTW, my blitter routines all use HOG mode.

What I'd really like to know is how to gather keyboard and joystick information directly from the hardware, and bypass TOS altogether in this regard. I'll probably have my own routines for directly writing the score to the screen as well.

I tried to grab the info at $fffc02 which is the input for the Keyboard ACIA. I know that in this case, my program would have to understand the difference between keyboard and joystick input. No big deal. Well, when I use this approach along with my blitter routines in the same loop, it still does not work out. I think that the keyboard processor is still trying to work with the system while the blitter is in HOG mode, and in that case does not know what to do, as HOG mode hogs the bus entirely. In that case it gets confused and says that input is ff, which it isn't.

I will entertain even flames on this subject at this point. But, I have a

few more ideas to try.

  Yes, but it is an example, you can use also mode 0,1,2 for ST: it will be
not very

beautiful but you can test the computer with cookie and do the right thing

I'd like to ask current and former Atari ST programmers with software
available for downloading or other forms of distribution to stop by my site
and take a few minutes to fill out a form.
I'm trying to provide a one-stop source for up-to-date registration
information on programs whose authors may have moved, physically or

electronically, since their software was made available. In addition, I plan on providing a synopsis of programs and system requirements for all programs.

Don't pay too much attention to the rest of the site yet, as geocities doesn't allow passive connections, which I seem to be limited to with TOS 1.62, and I have to use a local internet cafe to upload my pages. At the moment I am concentrating on compiling as much information as possible.

NOTE: There is one area in the form, under the heading "Support" that works fine with CAB, but I'm not sure whether it works with Netscape. I ran a test of it at the cafe, and it only returned 1 selection (I really can't remember whether I selected more than one item or not). Multiple items were returned from my tests with CAB.

Anyway, thanks for reading, and please visit the following page at your convenience:

Hey, how do they? Do they reprogram the 6301 and then send it new message commands by controling the 68901 to know when to poke the 6850's register? Or, does the 68901 create an interrupt which executes a routine which happens to be the proper time to peek the 6850?

Pleeeeeeeeeeeeeeeeeze teeeeeeeel meeeeeeee!!!!!!!!!!!

Hello to all

In <21031993_000003_OASIS_NEWS@the-gap.demon.co.uk> Gary Priest wrote:

>I might be interested in modifying POPwatch to use PPP Connect (as well as
>STiK etc.). To do this I obviously need programming docs for PPP Connect.
>
>Does anyone know if these are publicly available? If so, where I can get
>them? I guess they'll be in German which is going to be a pain :(

i was told, that the BLIP-Docus are the same then the Docus to PPP-Connect.

You need the documentation (the commands are the same as used in unix:
sock_init(), socket(), bind(), listen()) the only differencies are:

sread(), swrite(), sfcntl(), sclose()

which have all an "s" in front of the command.

But you hade to use an Library, in which these commands are defined.

With these Informations i tried to write a program, but i earned always an
errormessage from "socket()". So i the compiled program doesn't run.

The programmer of PPP-Connect (Sven.Kopacz@LB.maus.de) is now learning for
his university exam's, so he is now had to think about another problems.

Should i send you the BLIP-Archive icluding the Programmingdocumentation.
But it's in German!

Greatings Michael

Nope, I don't use TIN. There are some other, just as capable readers, out
there.

I usually take a walk or go out jogging or something. Excercise usuall
makes me focus on a problem. Otherwise going to a movie or watching TV
can help too. However since I use computers at work I usually takes
a walk in the corridores...

Sometimes listening to music can help too..

SetScreen don't work on for instance Hades. You would have to test
the video cookie to see if you are running on a Atari at all..

However being an old demo and game programmer I must add that
double/triple buffering is essential. It however hard to use that
with VDI/AES.

(Slightly off-topic)

I sometimes run into a snag in my programming, and find that if I just
walk away from the computer and go somewhere else.

Other times, I get a flash of inspiration while doing something completely
unrelated to programming.

Does this happen to you? If so, where are the favourite places you go to when you have a thorny programming problem.

Also, it has often been said (and is probably part of the hacker image) that programmers sit at their computers and consume large quantities of junk food and high caffeine drinks ("Mountain Dew" and "Jolt Cola" come to mind)

Does this sound familiar?

Just curious - I wanna see if I fit the Atari Hacker prototype.

(Sorry for being slightly off topic, but at least it is programmer related)

Yes, I recognise this... I frequently find this happens if I play a game
which doesn't require much thought, but requires concentration (eg Llamazap).

What type of communication do you want to do? The easiest way to
use the serial and parallell port is to use BIOS or TOS.

>

There are lots of C-compilers working on ST's including GCC...
I would recommend Lattice or Pure.

Possibly, I've had an idea to create a new traps routine for windows
- to use real windows instead... but I hardly think it would be that
good :-)

And because of the way STOS works, games wouldn't be multitasking, you
could run them with MultiTOS, but not be able to change to another
application/run another :-(

And BTW, I've created another extension called "NetWorld". It's
another extension for STOS which lets to interface with STiK to
connect to the internet! 8-)

I've recently started playing around with STik programming and
have run up against a small problem.

I'm trying to write a small talker program to enable others to
log on to my machine and send messages directly to me. (sort of
like an internet pager)

The problem is that data transfer only seems to take place when
my program is the top application or I interact with one of its
windows.

The problem is not with the programs evnt_multi loop as I include
timer events in that.

I have included the asm source code for the data transfer parts
of my program. Could anyone possible help me out?

HOW TO ATTRACT GIRLS INSTANTLY....Secrets to instant sex appeal

PURE INSTINCT PHEROMONE ATTRACTANT FOR MEN
WILL GIVE YOU AN UNFAIR ADVANTAGE WITH WOMEN
 GUARANTEED

(or your money back)!

Everyone knows that some men (a tiny minority) are able to instantly attract women. It used to be known as "animal magnetism". Scientists now say this natural attraction is due to pheromones - body smells that are not consciously detected, but that effect the behavior of others towards the person giving off these chemical signals. It's natures way of attracting the opposite sex. Scientists have now isolated and synthesized two natural Attractants- androstenol and androstenone pheromone. Carefully controlled experiments show they work and have been widely reported on television and in both the British and international press. Androstenone pheromone has been successfully tested on BBC TV's "TOMORROWS WORLD" and by Desmond Morris (Author of "The Naked Ape" and "Manwatching" and renowned human behaviorist) on BBC TV's "Friday Night... Saturday Morning."

New improved formula PURE INSTINCT from ICT Research Technology contains both ANDROSTENOL and ANDROSTENONE pheromone and produces and undetectable scent that subconsciously attracts women to the wearer. PURE INSTINCT is the world's number one selling and the most concentrated (5 - 7 x normal active strength) pheromone spray for men - don't be misled by cheaper (or more expensive) imitations.

WHAT THE PRESS SAY:

* Lowell Ponte, a former consultant on exotic weapons and a Readers

Digest science writer, said in an interview that "use of the recently discovered chemical Androstenone should be banned. Congress should pass a law making it a crime to use this chemical to influence voters by making politicians appear more lovable.
- The San Francisco Chronicle -

* "The stuff attracts women like you wouldn't believe"
- Colorado Telegraph

* "And now this pheromone has been marketed, we've tested it - and good grief it works"
- Koave

* "pheromones influence human behavior in a subtle way. Women are attracted to the smell"
- The Daily Telegraph

* "Pure Instinct is likely to produce a state of sexual excitement or arousal"
- Men Only (Vol. #44 No. 4)

Much of our sales of PURE INSTINCT are reorders from existing users, reports confirm success. "PURE INSTINCT really does seem to work! The most dramatic instances have occurred when wearing it at discos. Girls just drift towards me and start flirting."
-DT Cardiff

"I Knew PURE INSTINCT wasn't a gimmick when one of the girls at work, quite out of character, started to seduce me when we were alone in the office."
-SD Nottingham

PURE INSTINCT comes in a discreet 15ml pocket roll on container with full instructions, Ideal for any man who wants to join that lucky few who have more than their fair share of sex appeal.

30 DAY MONEY BACK GUARANTEE

If you are not 100% delighted with the results from using PURE INSTINCT simply return remainder within 30 days for a full refund- No questions asked!

I have put an extra 4 mbytes of DRAM above the MMU 4 Mbyte limit on an STFM.
I am using the original MMU + a small GAL to address this new memory.

Initially, I had problems where TOS 1.04 was not able to use this memory.

TOS 2.06 is able to use the memory, I use the Maddalt function to let it know
about the new memory.

I noticed that TOS 2.06 grabbed a chunk (16000 bytes) of this new memory for
itself right away. It appears to be using this memory as a buffer, for drop
down menus, window operations & possibly disk operations. Is this normal?

I believe this memory should be of the type 'TT Fastram', which means that It
cannot be used for screen or DMA operations. I expected it would be available
for programs only, I had hoped the system would not use it, but perhaps I am
mistaken here.

Does anybody know how/what happens when the ST finds extra memory?

Well there has to be something for memory.Or else PKZIP would just keep eating up memory until it crashed.I've run PKZIP on 1MB PCs before with no errors. PKZIP was writen long beofre there were 16MB PCs.

I have Pascal source code to some software, but I have no experience with
Pascal and do not have a compiler.

I am looking for someone who could compile the program for me for 68K TOS.

I believe it was previously used with "Turbo Pascal" on an IBM compatible
machine, if this makes any difference, and the source code is quite large.

If you could help me at all with this, please get back to me. Your
assistance would be much appreciated.

Pascal isn't known for its portability. Still, you gould try and
grab "p2c" from any good FTP site. p2c is a Pascal to C converter, which
has been used among other things to create a C version of TeX...

Assuming nothing in the source is machine specific (e.g., low level port
IO, embedded ASM, weird text or graphics modes), you should be able to
have it compiled under Pure Pascal, which is supposedly completely
compatible with Turbo, including the object-oriented stuff and BGI graphics.

Yes, the AES allocates a buffer of 1/2 the screen size (1/4 in pre-1.4
TOS) for that exact purpose.

> I believe this memory should be of the type 'TT Fastram', which means that It
> cannot be used for screen or DMA operations.

It is correct that you cannot set the screen display base to point to
alternate RAM, but the VDI can copy to/from it. The Blitter can't be used
to do the copies, though, so I'd imagine the VDI does a straight CPU-based
copy in this case.

> I expected it would be available
> for programs only, I had hoped the system would not use it, but perhaps I am
> mistaken here.

TOS is free to use any memory you add to the system as it sees fit. In
fact, you'll probably notice that desk accessories always load into
alternate RAM, regardless of their header flags. If you really wanted to,
you could probably write a hack to prevent it from doing so, but why
bother?

Normally, any request for memory (Pexec or Malloc) gets the largest
block of contiguous RAM, wherever that is, unless otherwise
restricted by the program flags or by calling Mxalloc().

Unless you have a blitter chip, there is no advantage for using ST
RAM for anything except the screen image and the floppy/ACSI DMA
buffer.

Here we go again, sorry it's rather late.

The new addition of ICTARI, the Atari programmer's disk-zine
is available at:

http://www.elis.demon.co.uk/ictari/ictari49.zip

(Demon's WEB-server seems to be taking a while to catch up,
the main site is http://www.elis.demon.co.uk/ictari/ictari.htm)

Anyone who's been threatening me with articles might consider
carrying those threats out if there;s going to be an ICTARI 50.

Have Fun,
"Augeas"

Gentlemen and Ladies,

There is a project going on to create a Virtual Macintosh Plus. It is operational at this time and is available as source code. It has been ported over to quite a few platforms. It would be nice if it were to be ported to MiNTOS. Being able to run Mac in a GEM window under MultiTOS would be quite nice. Especially if LAN support can be created and further support to bring it up to Mac II emulation. Here is the website to download the source code and other necessary files.

Hello MiNT programmers/users...

I am in the process of collecting patches for PL48 of the MiNT library. If you have been working with PL46 or PL47, and made modifications that are of general interest to the users of the library, why not have your contribution become part of the public release?

If you do not subscribe to the MiNT mailing list, and are unaware of changes since PL46, please dowload PL47 at funet.fi or ftp://ftp.cam.org/users/ypell, and verify that there is no duplication of effort between previous patches and yours.

Thanks

Yves Pelletier

Not trimming, cause I missed the in-between posts, (but found them on DejaNews).

I speculate that PKZIP crashed in parsing the file names for some sort
of final directory totals or something ... who knows exactly, but
not many programs can handle that many individual files (about 6300).
It may just have been a conflict with QEMM7.5 .. I do have to use
the PKZIP switch to turn off 32 bit DPMI usage as a mater of course.

I mostly wanted the PkZip file as a means to save redundant backups easily
(it takes too long to do anything with 6300 files individually).
I've got it done, and have the files individually on the Zip disk.

Subject: Z80 assembler found
Date: 1997/09/29
Message-ID: <J2TQCXM@tos.pl.net>#1/1
X-Deja-AN: 276368107
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.programmer

Some of you may remember my post a while ago about a Z80 assembler. I was looking for such an assembler suitable for using with an Atari ST series machine (actually a TT in this case).

I obtained Pascal source to such an assembler but was unable to compile it since I don't have a compiler (hence my post regarding the Pascal compiler) but fortunately I have found C source code to a Z80 assembler (also included in the package are 6800, 6801, 6802, 6803, 6804, 6805, 6808, 6809, 6811, 8085 and 8080 assemblers).

It compiled first time with Lattice C 5.6, and the resultant assembly seems to be correct, although I haven't checked every possibility. In combination with the supplied linker, the assembler can generate Motorola S19 or Intel Hex format output.

Now I just have to find out the format of the Motorola S19 or Intel Hex, although they look simple enough so I'm sure this won't be a problem.

If anyone else wants any of these assemblers, I would be happy to send them.

I believe the Motorola S Record specification can be found in one
of the Appendices in some of the CPU Manuals. Have a look at www.mot.com,
try a search for S Record or something...

Hello fellow programmers,

is there anyone who has tried to mp3 en/decoding on the atari (falcon).
I haven't yet found any atari related mp3 stuff, but since the source

code for mp3 en/decoding is pub. domain, I can't be the only one trying?

I got the source compiled, but it doesn't work, at least it can't get a
sync on the input mp3 file; I think it's got something to do with
little/big endian conversion of the input file to mp3 bitstream, but
right now I'm stuck.

any info or help appreciated..

greetz,
Vince

Yes there is a port on its way. I havn't heard from it for a while, but
I guess it's getting there. Last time I heard from him (Thomas
Berndtson)
he was busy with studies and wanted some help for speeding the
develpoment
up. Maybe you want to help?

Anyway, it sounded very promessing so I guess we will get a player one
day.

Thomas Much and Gotz Hoffart are begining work on The TOS Book.

This freeware HyperGuide and HTML document will eventually
document ever TOS enhancement (NVDI, WDIALOG, MiNT, etc.)
to become the definite replacement for reference materials
such as The Atari Compendium and the Atari Profibuch. Best
of all, IN PLAIN ENGLISH! ;-)

Should people with expertise in MiNT, MiNTnet, STiK, STinG,
OLGA, WDIALOG, NVDI or just plain Resource styling contribute
to this ongoing project, it might ensure the future of Atari.

Check it out on Thomas' Homepage:

Hello everybody,

I've put on my home page the October release of Eureka 2.12.
It's a 2D Graph Describer and a 3D Modeller. It's freeware
and will run on all Atari platforms and most emulators.
It has now, thanks to Karl SAMYN, an English documentation.
All the program is in two languages : French and English.
You may tell me more about the English translation, and
mistakes I would have made. I'm expecting a feedback for
it. Thanks to all ... Bye for now,

Not at all. I use the following piece of shit code in Kivi QWK
to get the stuff done (I'll add some explanation later):

```
void key_select(struct _key key)
{
	struct keytab {
		unsigned char *unshift;
		unsigned char *shift;
		unsigned char *capslock;
	} *ktab;
	short o=-1;

	ktab=(struct keytab *)Keytbl((char *)-1,(char *)-1,(char *)-1);
	key.ascii = ktab->unshift[key.scan];
	if ((kstate & K_CTRL) && (kstate & (K_LSHIFT|K_RSHIFT))) {
		switch(key.ascii) {
		case 'w':
		case 'g':
	}
	else if((kstate & K_ALT) && (kstate & (K_LSHIFT|K_RSHIFT))) {
		switch(key.ascii) {
		case 'r':
			o=MENU_REPLYTO;
		case 'e':
		}
	}
	else if (kstate & (K_LSHIFT|K_RSHIFT)) {
		switch(key.scan) {
		case 75:  /* nuoli vasemmalle */
		case 77:  /* sama oikealle */
		}
	}
	else if (kstate & K_CTRL) {
		switch(key.scan) {
		case 115:
		case 75:  /* nuoli vasemmalle */
		case 116:
		case 77:  /* sama oikealle */
		default:
			switch(key.ascii) {
			case 'o':
			case 'p':
			case 'q':		/* quit */
			case 'w':
			}
		}
	}
	else if (kstate & K_ALT) {
		switch (key.scan) {
		case 120:
		case 122:
		default:
			switch(key.ascii) {
			case 'k':
			case 'e':
```

```
            case 'p':
            }
        }
    }
}
```

As you can see I have removed much code, but you can
see the basic frame. The parameter for the function
is just the same keycode you get from the evnt_multi
(was it ascii in first 8 bits and scan code in the
upper part if I remember correctly). The kstate is
also the value from evnt_multi.
Then I just use the Ktabl function to get the
addresses of the tables and use the address to
get the reliable ascii code from the scan code.

It should be pretty straight forward. If you have
any question about that code, ask.

Oh yeah... the numeric codes there. For some keys
there just isn't reliable ascii code, so I used
scan codes to detect them. Keys like that are
arrow keys, undo, help etc.

I've to say that the limit of the number of window is a LEGEND !

Only the LAME desktop limits it's number of window. But it is
desktop's fault, and NOT AES's.
Try to open 256 windows, I'm almost sure it will work (I've never
tried).

>

Don't be silly ;-) We all try to be very helpful, and there is plenty of
software on the net!

> * The most modern OS that will work well on a 520ST. Remember, I don't
> have a hard drive!

Remember, the OS is in ROM, so upgrading TOS means replacing the ROM
chips. The latest version that will work on your ST is 2.06. There are
upgrade boards available that allow you to switch between the original
TOS and the new one, which is useful for compatibility with older games.

Without a HD, and with only 512K of RAM, I would forget about MagiC, Geneva, Mint, etc... which are modern multitasking systems.

>
> * A decent terminal program so I can get the ST on the net (Zmodem
> download would be needed).

There are several ZModem capable terminal programs (I'm not a specialist, but take a look at a few FTP sites), TCP/IP PPP and SLIP connection is now available with STinG, Web browsing can be done with CAB (you'll need at least a meg though), Usenet and email and FTP can be done with Newsie... There is other stuff too.

>
> * Manuals? Any old pro out there who no longer needs to refer to their
> 520 ST manuals? Even photocopies are welcome.

The manuals won't tell you more than how to copy a file, format a disk and save the desktop. I'm sure you can figure that sort of stuff on your own. There's a chapter about that in the Quick FAQ (see below).

>
> * Pin-outs and or manual for the color SC1224 Atari monitor.

Pinouts can be found here:

http://www.teleport.com/~atari/STinternals.htm#MONITORPORT

>
> * Music software for a MIDI keyboard (this is why I got an ST).
>

Just like on other platforms, the best ones are commercial, Cubase, Notator, Logic... you often see people selling second hand copies on this group.

Otherwise, Alchemie or Sweet Sixteen are shareware seqencers that can be found on the net. I don't have the exact addresses, but they can be found.

> Thanks,
> Jill

I suggest you take a serious look at my Quick FAQ (the address is in my .sig). The ST can probably fulfill most of your needs. Don't give up!

The folowing lines does what you want to do. I'm sory if you don't
understand assembly language... but I hate C !!! To slow and unexpressive
(just have a look a PureC bindings and you will see what I mean...).

```
    clr.l    d7                      ; We take the scan code returned by
    move.b   int_out+10,d7      ; evnt_multi() : the highest byte of int_ou+10
(int_out[5] in C).

    Keytbl   #-1,#-1,#-1             ; Let's find the ascii table coresponding to
the
    move.l   d0,a0                   ; scan code (UPPER CASE)

    move.l   4(a0),a0
    add.l    d7,a0
    move.b   (a0),ascii_key
```

Have a try...

I always found it much easier just to check the ASCII code and keyboard
shift state separately.

This is not only easier, but also ensures compatibility with any keyboard
layout.

Is there some reason why this is an undesirable method?

That's exactly the problem, if somebody writes code to check the GEMDOS version, look what can happen.

Prog #1 checks version of GEMDOS, gets 0.15.
Program quits because it needs functions included since GEMDOS 0.19.

Prog#2 checks (same) version of GEMDOS, gets 0.21.
Program then crashes because functions it needs are not present.

I am now fairly sure that I have version 0.15 & that the version should be called 0.15, because the 'Maddalt' function is included in GEMDOS 0.19 (& upwards) & I don't have this function.

I was looking at some old example code that was supplied with Devpac.

One of the files had text refering to a CP/M 68K reference guide.

The HEX number is the correct one. I.e. 0x1500 should be interpreted ad 0.15, 0x2100 is 0.21... If a sysinfo program returns the decimal value it's simply wrong and misleading.

> Prog#2 checks (same) version of GEMDOS, gets 0.21.
> Program then crashes because functions it needs are not present.

It also crashes because it doesn't use Sversion correctly. All official docs clearly states how the returned value should be interpreted.

Btw. I don't think 0.21 really exists, according to the Atari Compendium the actual versions are 0.13 (1.00, 1.02), 0.15 (1.04, 1.06), 0.17 (1.062), 0.19 (2.0x, 3.0x, this is where alternative memory was introduced) and 0.30 (4.0x, MultiTOS).

I had a quick look at the MiNT-sources (1.14.3), and it looks like it only

supports Maddalt() if the original GEMDOS does. So it looks like you have
to either fit 2.06 or buy MagiC...

I guess that the AES has a limit, especially since WinX increases the
limit to 40 windows, even under 4.04. According to the Atari Compendium
the limit was raised from seven (Only 4 under 1.00 and 1.02) to infinite
(memory permitting :-) in MultiTOS, a.k.a AES 4.0. This suggests that TOS
4.04 is limited to seven windows.

Does this mean that MiNT + AES 4.1 support alternate memory, even if the
underlying TOS does not?

Does AES 4.1 replace all of TOS , or only the AES portion?

I was reading the Compute! TOS book & found a BIOS function called 'Getmpb'
(get Memory Parameter Block).

This is used by GEMDOS to initalise the memory management.

If you use this function, it returns three pointers to memory descriptors.

I looked at the structures & it seems that it should be possible to hook into
these, although the book warns about changing these after initalisation.

There is also a location ($49E is TOS 1.04) which appears to be a pointer to
another mpb. This is currently set to NULL. Would it be possible to create
another mpb & put the address here, then link to the main mpb?

See below.

> Does AES 4.1 replace all of TOS , or only the AES portion?

AES 4.1 is strictly speaking a standard, not a program. But the GEM.SYS 4.1 that's floating around is just a new AES that runs on top of MiNT.

> >I had a quick look at the MiNT-sources (1.14.3), and it looks like it only

MPB doesn't make any sense under MagiC or MiNT, so if you use it it will probably break under anything but plain TOS and perhaps Geneva.

> I looked at the structures & it seems that it should be possible to hook into
> these, although the book warns about changing these after initalisation.

And MiNT (and MagiC I believe) uses a completely different way of organizing memory,
so it won't work unless you use plain TOS.

> There is also a location ($49E is TOS 1.04) which appears to be a pointer to

Haven't got a clue, but as a general rule you should not mess around with MPB. It's
highly version-dependant and won't work at all under several OS'es. Upgrade to 2.06
or get MagiC! Unless you play a lot of old games I'd go for the 2.06-options, as it
gives you more freedom than MagiC (E.g. you could use the alt. memory under MiNT and
TOS as well.).

If you wanna be really evil you can get a TOS image for TOS 2.06 off one of the Atari Game sites, which is sort of illegalish. But anyway, you could then load that TOS from disk on bootup and end up with a newer TOS and more memory minus the size of the TOS image. May be worth a try?

Not true. There *is* a limit of 7 windows total (the desktop is always "open", and it's #8) in all AES versions prior to the one included with the Falcon and MultiTOS. Trying to use wind_create() to create anything past 7 will result in an error code.

The lame desktop in older versions of the AES did have a ridiculously low limit: 4, even though the AES was capable of opening 7. This was prior to 2.x/3.x, IIRC.

Newsgroups: comp.sys.atari.programmer

Hi guys,

I need to be able to extract the sample rate from *.AIF format sample files, but the number is stored in the file in 80-bit IEEE floating point format, and I need to be able to convert this into a readable number.

GFA supports "double" values which are 8-byte IEEE floating point format, but this doesn't seem to help much, either.

So, any clues?

Here's some examples, with the 10 bytes of the IEEE format number, and some sample rates to which they represent:

```
  8K = 64,11,252,160,0,0,0,0,0,1
 16k = 64,12,252,160,0,0,0,0,0,1
 22k = 64,13,171,108,0,0,0,0,0,1
 32k = 64,13,244, 36,0,0,0,0,0,1
 44k = 64,14,171,109,0,0,0,0,0,1
 48k = 64,14,184,157,0,0,0,0,0,1
```

So, how can I interpret those 10 bytes into the corresponding sample rate with GFA?

```

Hi Uwe & Everybody

Today, due to my colour booting problem (another thread) and various unexplained crashes under MagiC, I zeroed my boot partition and reloaded HDDriver, NVDI, MagiC etc.

My ZIP drive seems to be behaving better now. So problem solved for now :) It certainly seems to recognise a disk now, even if I boot without one in the drive. I haven't checked the other problem (swapping from a 1 partition disk to a 3 partition disk and vice versa). If it's still a problem, then of course I'll repost in here :)

Regards,
Gary

This part of the compendium has a couple of typos - I cannot find the
corrections file atm, but I know that TOS 1.00 also had a max of 7 windows.
I also seem to remember that they said that they corrected it to say that
it was AES 3.3 that changed the limit, but I'm not certain on this point...

Anthony

Most of the good MIDI stuff needs 1 meg to run. Also you need the SM124
mono monitor for most of them. Chances are the TOS in your 520 is the
dreaded 1.0, and that the floppy drive is only single sided.

best of luck with it.

If you access the hardware direct, you will receive a
message from the IKBD when the key is pressed
and another message when the key is released.
But you should of course not do this! :-)

It shouldn't crash because of lack of memory.MS-DOS programmes must ask the OS to use memory.It's up to MS-DOS to tell it where the free memory is.
Actually,this is how the Atari works too.
PKZIP should just get a error from MS-DOS and exit.And PKZIP (2.04g) uses XMS memory.(and EMS,but nobody uses that anymore)

How much MS-DOS and XMS memory do you have?

Does anyone know how can I make (and display) a little color-sprite on
the screen ?
Have you a little C source code to show me ?

Thank you very much!

I had a look at BigDOS 8 today, and it seems like it supports Maddalt(). So try BigDOS and see what happens.

Just out of curiosities sake, I booted up my sons 1040 ST with TOS 1.0 and it goes to 4 open windows before saying I must close a currently open window before I can open another one... Tried the same thing with my TOS 1.04 Mega ST, and it went to 4 open windows also...Then I tried it with TOS 4.04 on my Falcon...the number there did increase to 7... :)

Shame on you. Forcing your son to use a 1040 with TOS 1.0:).
I "loaned" my Mighty Sonic Falcon to my 14 yearold with the hope that he is
able to pick-up Calamus and Papyrus. Everytime I go into the room, he has
some game fired-up.....He has done some work with M.A.G.E., but only with
sprites so far. Wait until the book reports are due:). Last year I got him
going with PageStream, but I was hoping he could teach me how to use those
fancy ones:).

Mike

And if the requested amount of memory is not available then the OS will say so.
And of course every programmer always
- checks the result of every system call
- writes appropriate code to deal with the case that the system call failed
- actually tests all of these special cases to see that nothing bad happens.

And I have a claim on some Martian real estate that you really should buy.

Hmm.. perhaps it was raised to infinite already in TOS 4.04?
I can open over 25 windows (I got bored opening them after that)
with TOS 4.04. Of course not with the desktop...

Although I do remember reading back when MultiTOS was released
that MultiTOS expanded the number of windows open to infinite.

Currently GEMMA works fine under MultiTOS and even a multitasking GEM
application has been programmed which works in the STOS interpreter!
There is no visable methods to tell a GEMMA/STOS program to another
language.

Hi Thomas

Thanks for the example below. It's just what I needed. I do indeed understand assembly language. It's what I write *all* my Atari programs in. I'm not much of a C programmer at all :)

Thanks to everyone, who responsded to this thread, it's much appreciated. I am now able to put proper keyboard shortcut handling in POPwatch, CoSTa etc.

Cheers,
Gary

```

Yes, this is the desktop - try it again with something like Everest - you'll get 7 windows (like I just did on my 1.00 STfm).

```
> Then I tried it with TOS 4.04 on
>   my Falcon...the number there did increase to 7... :)
```

Strange - Desktop on my Falcon allows 8 windows - but this is a desktop limitation, not the AES - in Thing there is a limit of 16 windows (I expect forced by Thing), while Everest (3.5e) allows me to open 10...

Try it. :-)

Anthony

I've just recently bought PageStream 2.2se for my Falcon so I'm just really getting used to it. Do you have any suggestions on how to get it to bootup faster on the Falcon? I've set the fastload bit, and I've gotten the paths correctly set to my hard drive, but it still seems to take a long time to start (especially compared to most other programs) I'm hoping Kyle will develop a taste for more "serious" stuff as we go along...! :)

Thanks for any suggestions...!

I would suspect that this has got more to do with the desktop than the
TOS/AES
limit it self. The desktop has also got a limit in how many icons you
can have
on the desktop so it wouldn't suprise me if it has got the same limit
with
windows. Try to run an alternative desktop and see what the limit is
or make a program that opens as many windows as possible.

IIRC, each of the printer drivers is an executable program, as well. You can make PGS load faster by removing any drivers you don't usually use, and also by setting their fastload bits. But if you start getting crashes, the fastload bits should be the first thing you change back.

  Hey, Dan! Mucho thanks for the tip, I'll try it out and let you know...!

  Thanks again... :)

So, would it be possible to put a STOS game in a GEM window then?
That would be cool. Just open a window and all drawings to the screen
will be redirected to that window. Mqybe not that usefull on a ST, but
on a Falcon or Hades ir would be cool. :-)

You'd best use vro_cpyfm() then... I could look up some example
code for this function if you like. Only problem would be getting
rid of flickering. You could try double buffering, but it'll use
a lot of CPU time on a system without blitter (and a lot of bus time
on a system with blitter).

Not having written a game I've not done this but it should work:

The likes of vro_cpyfm() are much easier to use if they work on the screen. So, if we declared a second block of suitably sized and aligned memory for a shadow screen we could toggle logbase to write to each with a simplified vro_cpyfm() and physbase to show the required screen.

If multitasking is a consideration then the only problem which should arise is when logbase is not set to the original place. Either we could stipulate the game be installed singletasking, or block task switching until logbase reverts to the original place which it will do often enough with a half decent frame rate. By its very nature, there wouldn't even be a need to allow a user preference which method is used.

For double buffering you will not need to make copy of screen
but use the xbios (first) to set your new screen for your game
with Setscreen(0.L,0.L,3.W,mode.W) and switch your screen (second) by a
Setscreen(your buffer,your screen,-1.W). Don't forget to swap the address
of the screen before do it. The Xbios will perform a Vbl sync to swap
the adress.

I believe that a lot of the CIS stuff exists at UMICH and also on the
PoolDisk that was produced by Ernest and Bo Schreurs in The Netherlands
about two years ago, but I also see that William Kendrick replied to
your message, so I'm going to look at this reply before commenting
further on UMICH.

Hello.

     I'm about to get a BASIC language, and I think that GFA 3.6 is a
good choice but I ear of some problems running it on a Falcon. Any advice
on this subjet?

     Is this language still being supported?.

Regards.

Daniel

Help discovering what all of the 8.3-named files are and getting
descriptions (blurbs) for them written and categorizing them.

  Is this a recent copy of their data? I know umich (?) has a bunch of stuff
from CIS but I know they don't have everything. I remember their being tons
of stuff more when I last used CIS in the 80's. When the new version of 1030
Express came out. In fact, there should be a program of mine up there that
converts version 2 to version 3 phone files.

  If you want some help I could lend some time to it. I'm not sure how you
want to do it though. A large tar ball of some stuff would work for me.
(Guess I should get the Unix Atari emulator up and running...)

6.3-named files, if you can believe it.

Subject: Problem with gdb?
Date: 1997/08/31
Message-ID: <5uaiuv$5n2$1@News.Dal.Ca>#1/1
X-Deja-AN: 269136218
Summary: gdb doesn't work
Organization: ISINet, Nova Scotia
Keywords: gcc, gdb, symbol table
Newsgroups: comp.sys.atari.programmer

 I'm having a lot of trouble trying to get the GNU debugger (gdb) to work.
Some help would be greatly appreciated! See below for a description of the
problem.

Thanks,
John

==========

System:
AtariST (Mega STE, 4MB Ram, TOS 2.05). I'm not using MiNT or MultiTOS or ..., just plain old single tasking TOS.

Followed instructions in gcc-st.txt (dated 1992), by Frank Ridderbusch; using gulam (with appropriate environment variables set).

```
$ gcc -c -g hello.c
$ gcc -o hello.tos hello.o -lgnu
$ sym-ld -o hello.sym d:\gnu\lib\crt0.o hello.o -lgnu
```

('sym-ld -ohello.sym $GNULIB\crt0.o hello.o -lgnu' also works)

```
$ gdb
(gdb) exec-file hello.tos
(gdb) symbol-file hello.sym
```

gdb produces the message:

```
" Reading symbol data from d:/gnu/gnushell/examples\hello.sym...
 Ranged type doesn't fit within known sizes. On an atariST this is
 most likely due to objects compiled with the "-mshort" option to
 gcc. Please re-try by specifying the "-mshort" option on the gdb
 command line.
 n2 == -559939584, n3 == -1389945743 "
```

==========

I've tried using 'gdb -mshort' but the same message results. I've also recompiled with 'gcc -mshort' and linked with -lgnu16; again, the same problem arises. Have also tried using gcrt0.o instead of crt0.o.

==========

Version numbers:

```
gcc       Version 2.5.8 Pl 1
sym-ld    Pl 36 (Jul 1/93)
gdb       2.6 Pl 18
```

==========

hello.c is:

```
#include <stdio.h>
main()
{
  printf("Hello world\n");
}
```

> proportion = 3000 / 9000 = 0.33333333
> width_to_draw = 400 * 0.33333333 = 133.333332 (round to int = 133).

> You will notice that 133 pixels is a third of a 400 pixel bar. :)

Personally, I'd calculate it a little different:

```
  width_to_draw = (amount_read * max_width) / total_size
```

which mimics the inline Lattice C code

```
  width_to_draw = umul_div( amount_read, max_width, total_size )
```

This can all be done in integer arithmetic, leaving out any floating point
math which is _much_ slower (even with an FPU) which your algorithm seems
to require.

With my algorithm and your example data (assuming the range is 0..32767)

```
                            ; d0      d1      d2
  move.w  amount_read,d0    ; 3000    <undef> <undef>
  move.w  max_width,d1      ; 3000    400     <undef>
  move.w  total_size,d2     ; 3000    400     9000
  mulu.w  d1,d0             ; 1200000 400     9000
```

```
  divu.w  d2,d0             ; 133     400     9000
  move.w  d0,width_to_draw  ; 133     400     9000
```

Whereas your algorithm would need either an FPU or a floating point library (using your algorithm with integer arithmetic would make your bar either zero [lines zero through 8999] or full size at line 9000)

```
With an FPU                   ; fp0     fp1      fp2
; FPU will perform int-to-float and float-to-int conversions internally
  fmove.w  amount_read,fp0    ; 3000.0  <undef>  <undef>
  fmove.w  total_size,fp1     ; 3000.0  9000.0   <undef>
  fmove.w  max_width,fp2      ; 3000.0  9000.0   400.0
  fdiv.x   fp1,fp0            ; 0.3333  9000.0   400.0
  fmul.x   fp2,fp0            ; 133.33  9000.0   400.0
  fmove.w  fp0,width_to_draw  ; 133.33  9000.0   400.0
  ; FPU sets "INEX" inexact flag during round-to-int while processing
  ; fmove to memory  (133.33 -> 133 is inexact ["data is lost"])
```

```
Without an FPU  (Assume all float math is in 64-bit doubles)
; Assume all float math is done in 64-bit doubles.
; Operands are placed in _fop1, _fop2 as required
; Results are returned in _fres
; except for float_to_word which returns in d0
;   and word_to_float which returns in d0/d1
  move.w   amount_read,d0    ; pass param to convert in d0
  jsr      _word_to_float    ; convert it
  movem.l  d0/d1,_fop1       ; move double to float math operand 1
  move.w   total_size,d0     ; pass param to convert in d0
  jsr      _word_to_float    ; convert it
  movem.l  d0/d1,_fop2       ; move double to float math operand 2
  jsr      _fmul             ; multiply operand 1 and two
  movem.l  _fres,d0/d1       ; get double result
  movem.l  d0/d1,_fop1       ; move result to operand 1 for divide
  move.w   max_width,d0      ; pass param to convert in d0
  jsr      _word_to_float    ; convert it
  movem.l  d0/d1,_fop2       ; move double to float math operand 2
  jsr      _fdiv             ; divide operand two into operand 1
  movem.l  _fres,d0/d1       ; get double result
  movem.l  d0/d1,_fop1       ; move result to operand 1 for integer convert
  jsr      float_to_word     ; convert operand 1 to 16 bit integer
  move.w   d0,width_to_draw  ; store 16-bit value in memory
```

I don't recall which language you are using, so I hope what I've just spent about half-an-hour writing was helpful.

For screen memory not a lot has to be done. Clear the contents of the
source and destination memory form structures (FDB structures in MWC
compiler) and use the exclusive-or (or NOT destination) writing mode.
Set the source and destination co-ordinates to the same values.

Sorry, I've no code for this atm. :-(

Maddalt() exists from gemdos 0.19 and in (later at least) MagiC
versions. It's used to add memory areas not recognised by the BIOS.
For programs to use this, either their alternative ram load bit should
be set, or Mxalloc() should be used. [see compendium, section 2.81]

>Has anybody else done anything like this?

I believe Peter Rottengater has done so.

: Hello.

: I'm about to get a BASIC language, and I think that GFA 3.6 is a
: good choice but I ear of some problems running it on a Falcon. Any advice
: on this subjet?

I have heard that GFA 3.6 does work well with Falcon from someone who is programming with v3.6 on a Falcon. GFA 3.6 is designed for working with the TT. GFA 3.0 and 3.5e were designed with the ST in mind, v3.5e has some nice extras for the STe models.

There are of course other versions of BASIC...

STOS - Game creator BASIC, good for game and multimedia authoring, athough is powerful enough for creating other types of applications. Language can be extended by adding or writting extensions. Machine langage programs can also easily be incoporated to speed up time crittical operations. The biggest downside to STOS is it does't truly use GEM, although there is now an extension called GEMMA to add a GEM like interface to STOS applications.

Hisoft BASIC, although I've never programmed in this particular version of BASIC, I've read reviews, and listened to programmers who write in it. They say it's as good as GFA BASIC, some users say it's better (natural bias). :-)

GFA BASIC is nice, I write with v3.6 on my 4meg TOS 1.02 STFM, so I can't say I've got direct experience working with it on a Falcon. Good editor, fast interpreter, and a compiler. Also comes with a Resource Construction Set.

There are also a bunch of somewhat forgotten BASICs like Fast, or True BASIC, and of course the much loathed ST BASIC.

: Is this language still being supported?.

Hisoft BASIC should still be supported. If your worried about support from the manufacturers and distributers then maybe that's the version of BASIC you would want.

Times running out... TTYL...

OK, OK ... something convinced me to grab the files before
they vanish, so I now have all the files from section 11 and
12 of the CI$ ATARICOMPUTING forum, though I have to kludge them
together into one place (section 11 was grabbed with Qmodem at work,
while section 12 was grabbed with Tapcis, a much smarter CI$ aware program).
I will have to write a parsing program to split out the file descriptions
into the individual description for each file that Tapcis does to get them
consistant, but that shouldn't be too much trouble. 1800 files in section 12,
I haven't yet looked into the section 11 stuff yet.

The paper listing I had at work is definitely gone ... I hope I have
the original files on a 6809 Flex disk someplace.

Yes, this is equaly valid (it is, after all a simple substitution of
proportion in my equations) - I was doing it in that order to hopefully
make it a little clearer were it came from...

> This can all be done in integer arithmetic, leaving out any floating point

Yes, that is true, although with big files (>10 meg) with a bar of 400 pixels
you could reach the limit of integer sizes...

> I don't recall which language you are using, so I hope what I've just
> spent about half-an-hour writing was helpful.

The original poster was using GFA, IIRC... (although I use Lattice/asm)
Interesting info though. :)

no problems :)

file size=9, done=3, box size=40.

proportion = 3 / 9 = 0.33333333
width_to_draw = 40 * 0.33333333 = 13.3333332 (round to int = 13).

Newsgroups: comp.sys.atari.programmer

Hello,

If you were using a data base program, what would you like to have fast searches of? Such as Last name, phone number, E-Mail, e.t.c. In other words what would you like to have stored in memory, so when searching for a particular person, phone number, you don't have to wait for file reads and stuff.

Also anyone know how to check and see if a file is a proper file to be used with ones program. My program brings about a file selector. The user can then select the particular file to load. IF the user chooses a different file, than the type intended, how do I tell? I'm currently using the MOD command to test the file length. If a remainder is returned than its not the file my program uses. This is not very efficent though, because a user can select a file which has the same record/field setup as mine.

Eg..

```
OPEN "R",1,file$,30
size=LOF(#1)
test=size MOD 30
IF test<>0
 wrong.file!=TRUE
ELSE
 wrong.file!=FALSE
ENDIF
```

What if the file they selected is divisble by 30? My program loads it and then mucks up all the array stuff.

Who would want to do something like that anyhow :)

Scott,

Hi all.

I have more than 1,000 TIF and JPEG images, and I want to decrease them from 200dpi to 78dpi in Batch program.

How can I do it ?

P.S - I know that there is a program "Image Alchemy" is doing it, but it costs money... (where can I find a free version and not only the Demo ?)

Please Help...

Sorry to butt in Tony, but you're over emphasizing the file-selector here. :) GEMMA allows access to all of GEM - there are various demo programs making use of windows and dialogues etc. There are commands implemented for all AES and VDI calls (even AES 4.x).

BTW. GEMMA is still a beta version...

I would certainly recommend HiSoft BASIC.

The IDE is, IMHO, much better than that of GFA BASIC, and a commandline version of the compiler is supplied also, so that you are not tied into the supplied IDE in any case.

HiSoft BASIC is supplied with libraries covering all of the BIOS, GEMDOS, VDI and AES, unlike GFA BASIC where what functions are included are often implemented in a nonstandard manner, but where many functions are not included at all.

HiSoft BASIC is fairly similar to other standard BASICs, which can be useful if you want to use the software on various different versions of BASIC, on different platforms for example.

I could go on, but I think you get the picture. If you have any specific queries you can contact me. I have used GFA BASIC, HiSoft BASIC and STOS I would recommend HiSoft BASIC over all of those.

I have heard that Omikron BASIC is very good, however, so you may want to look into this.

  I got a bare-bones 520ST about a year ago, with one boot floppy, no manuals and no HD. Due to the scarcity of help and software, I'm on the verge of selling the system. Can anybody provide me with:

* The most modern OS that will work well on a 520ST. Remember, I don't have a hard drive!

* A decent terminal program so I can get the ST on the net (Zmodem download would be needed).

* Manuals? Any old pro out there who no longer needs to refer to their 520 ST manuals? Even photocopies are welcome.

* Pin-outs and or manual for the color SC1224 Atari monitor.

* Music software for a MIDI keyboard (this is why I got an ST).

Thanks,
Jill

You could put some identifying header on the file that would not be
present in other files. This way, to read in the file you would read the
header, and if the header indicated that the file was in the correct
format, for the correct version of the software etc., you would continue
loading the file. Otherwise, an alert could be displayed informing the
user that the file is not the right type, version etc.

Somewhere in the distant past I used to play around with an ST....I upgraded it to
1 meg and added a hard drive.....Somewhere I reckon I still have lots of
source code....and probably some games.....I dumped the hard drive (sorry) but
I should have some magazines (ATARi User etc...) I will look them out.

I am in Scotland UK. Tell me where you want the stuff sent (I'll pay postage if
it doesn't
cost an arm and a leg).

I can be found at Compuserve 101233,1641
or
witurne@ibm.net

Give me a call

Yep. These are the bits for Kbshift. But how do they relate to Keytbl?

The ASCII code should be in the lower eight bit of the scancode returned by evnt_multi(). I'm not sure though, as the Atari Compendium isn't clear about this. The SHIFT/ALT/CONTROL state is also returned by evnt_multi().

> There are four different keyboards avalible for atari computers. German,
> English, USA, and French. You can determine which keyboard is attached

What about Norwegian or Swedish keyboards? Or PC/Mac keyboards? Dvorak?

The keytable can be modified to any keyboard imaginable, so the correct
way to check for keypresses should be the ASCII-value, with shift-status
checked separately if necessary.

I have an STFM with TOS 1.04

Using two different 'sysinfo-like' programs, I get conflicting GEMDOS numbers.

One program reports GEMDOS @ version 0.15, the other at version 0.21.

Does anybody know which is correct for TOS 1.04?

Also, is the Atari Compendium still on sale ?

Btw, I heard that Caldera (the current copyright owners of Digital Research's
stuff) have allowed the source code for GEM to be placed on a web site.

There is also something called CP\M 68K.

Am I correct in assuming this is the ancestor of the Atari OS?

Hi guys

I posed this question a few months ago when I got my ZIP drive and never really got an answer.

I am running a Falcon with MagiC 5.11 (also used to be 5.03) and HD Driver 6.0, and MagXDesk.

I have a ZIP drive attached to the SCSI port.

If I boot my Falcon and there is no disk in the ZIP drive then I can't access it at all even when I put a disk in. I have to reboot. All I get is a gemdos error (can't remember which one, something like invalid drive).

If I have a disk in the drive with say 3 partitions, and then eject it and insert a disk with one partition, and try to access it, I get the same gemdos error as above. :(

Is this normal behaviour, or is it a bug in MagiC, MagxDesk, or HD Driver?

Seems very poor to me. If it is a bug, would it be possible to write a workaround (ie something that flushes the disk details and does a mediach)?

But surely the Falcon should recognise the disk has changed (or been inserted) and adapt to suit it?

Gary

It depends which way you look at the number. Another posting in this thread points out that the function which returns the GEMDOS version gives 0x1500. If you treat the upper byte as binary coded decimal, you get version 0.15; if you treat it as hexadecimal, you get version 0.21 (1*16+5=21). I remember reading somewhere about this, and the article/posting said that even Atari was inconsistent in which way to treat the version number.

They only differ in the interpretation of the number. The value that GEMDOS returns is 0x0015, but 15 hexadecimal is 21 decimal. Both are more or less correct.

  Amazing isn't it? That an entire platform's files fits into a ZIP disk....

  Is this the A8 files only, or 16bit too? Is this every file uploaded to
CIS _ever_, or do they remove old files after some time?

> I would really like to get a single file or three to simplify
> and speed backing up.

  Perhaps I can help? I have a ZIPper on my Mac that I find to be much
more reliable than the ones on the PC, notably on large files like this.

This is one of the problems with removable media. If you run
NEWMEDIA.TOS after changing the disk it should be fine.

I'm using OPENW 0 in my GFA BASIC program. When trying to enable
thte cursor ~XBIOS(21,1,0) it does not appear at the coordinated I locate
it at. Such LOCATE 20,5 and then ~XBIOS(21,1,0) the cursor appears in
tthe upper left most part of the screen and refuses to move. WHY? Does
OPENW 0 effect not allow cursor to be active in it. I know all GET
x,y,x,y,screen$ commands y co-oordinates have to be increased by 19,
because of menu bar area. What about the cursor. Also how do I get the
cursor to blink?

Sounds suspiciously like the system thinks the media is fixed. It
wouldn't surprise me at all if you got the same message off your main
hd then discovered the cable had come loose!

>Is this normal behaviour, or is it a bug in MagiC, MagxDesk, or HD Driver?

Unfortunately I haven't a clue but finding out what HD driver thinks
it is would be the place to start. Assuming that it works ok under TOS
would imply the next place to look would be MagiC then finally
MagxDesk.

>Seems very poor to me. If it is a bug, would it be possible to write a
>workaround (ie something that flushes the disk details and does a mediach)?

I would *guess* that a simple mediach should do the job if it's going
to work at all because of the below ...

I remember yonks ago using Sysmon or something on the filing system
and saw my gasteiner driver was making oodles of pointless mediach
calls to my (fixed) hd. Except, they wouldn't be pointless if the
driver couldn't tell the difference between fixed and removable media
but still wanted to support removable media?

So give Mediach a whirl and see!

>But surely the Falcon should recognise the disk has changed (or been
>inserted) and adapt to suit it?

Dunno. I just discovered my Zip will not eject manually under NT. This
of course could be because I've done something wrong, more probably
BG! On the other hand it could be because there is no way for NT to
find out atm. NT does know the media is removable because it will
software eject. Perhaps something similar is going on in your case -
no hardware sensing (easily answered by someone) or no software
looking at it?

Oh - does hitting ESC on a window open on the zip's root dir have any
effect? Bit kludgy but better than nowt!

I don't know about the newest version of HD driver because Toad
Computers retained my original 4.? version and never sent me the
upgrade, but the version I have will not relog the drives without
rebooting the computer. That means if a removable media is not active
when the computer is booted it cannot be accessed without rebooting.

I had hoped that Uwe would fix that by adding an option to relog the
hard disks to a CPX as ICD software does. Sounds like he hasn't done
that yet. My version of HD driver does correctly deal with media
changes if my Syquest drive was ready at bootup.

TCache has an option to force a media change each time the specified drive is accessed. I would think this would work for him.

Geneva hasn't been tested, but I dont see any reason why not. Due to some dirty memory handling code in STOS (which is gradually being replaced), there are potential problems under any multitasking system, so I wouldn't care to say if it works... but it might.

Currently the release versions of GEMMA are interpreter only - so compiled programs cannot (ATM) access GEM under single or multitasking systems.

BTW. GEMMA has a homepage at: http://www.users.zetnet.co.uk/pjones/

I'm using an STE with TOS 1.62 and HD Driver 6.0

> I have a ZIP drive attached to the SCSI port.

I have a SyQuest EZ-135 on the DMA port, using Gasteiners host adapter.

> If I boot my Falcon and there is no disk in the ZIP drive then I can't
> access it at all even when I put a disk in. I have to reboot. All I get is a

I can access the '135 if I manually load HD Driver.

> If I have a disk in the drive with say 3 partitions, and then eject it and
> insert a disk with one partition, and try to access it, I get the same
> gemdos error as above. :(

It could be that you've not set the sector size large enough and the new
disc has sectors larger than the minimum. I have a similar problem when I
change '135 discs where the partition sizes are different. This is
especially true when the first partition is of a very different size.
Usually when a disc is changed, I open drive C:s window and then have to do
a reboot.

> Is this normal behaviour, or is it a bug in MagiC, MagxDesk, or HD Driver?

Since I have a similar problem under TOS, it would appear to be something to
do with HD Driver.

> Seems very poor to me. If it is a bug, would it be possible to write a
> workaround (ie something that flushes the disk details and does a mediach)?

I think it would need to completely read the partitioning information from
the discs and reset it's tables again.

> But surely the Falcon should recognise the disk has changed (or been

A8 only .. libs 11 and 12 ... plus the St Transformer files from lib 5.
If I dig out an ancient CI$ listing from the old 8 bit forum, I should
have an idea if things were deleted .. I suspect yes, but perhaps someone
more active in the CI$ forums would know now.

>

Did, done .. single Pkzip file .. 24 megs or so. Pkzip bombed on my
system (choked perhaps) possibly due to my own system memory constrants,
but the file was there deleted, so I undeleted it and it looks valid
(passes the Pkzip -t).

I have a SyQuest 270MB removable drive on my TT with HDDriver, and
sometimes I do observe similar problems. Usually, however, swapping
cartridges "on-the-fly" works fine.

Occasionally, after I swap a cartridge, it appears as though no files are
present on the cartridge. Rebooting brings everything back to normal. I
have never figured out quite why this is.

In any case: remember to set the number of partitions to reserve
appropriately, and remember to set the sector size in the HDDriver setup
so that it is at least as large as the largest you will be using.

Hopefully this would help solve the problem.

I have a similar problem with my ST (but with a Syquest EZ135 drive)

Try running the mediachange.prg on the HDDriver master disk.

I'd also recommend that you take this to comp.sys.atari.st as Uwe Seimet is a regular there and is likely to suggest a few things to try.

Speak to 'ya later!

Yeh but I think its better to be able to go back just incase the
button was clicked on by accident and IMO it is better to allow this.

>I wrote my own form_do for pug yonks ago and I also had problems with
>graf_watchbox (and graf_mkstate for that matter). My own solution was to
>write a replacement watchbox routine.

I maybe wasn't very clear with this so:

1) When the window with the button in is the topped window everything,
   including graf_watchbox works fine.

2) If the window is not topped then it locks up until the mouse button
   is released so by the time that the graf_watchbox is reached the
   mouse button is no longer held down so it just 'flows' straight
   through it.
   My original question was to do with clicks on untopped windows
   inquiring whether or not it was possible to recognise these clicks
   without the AES blocking until the mouse button was released due to
   the AES sending wm_topped.

I don't know if that makes sense to anyone but its the best way I can
think of to describe what is happening.

>However, along with the compendium came two hitherto undocumented
>functions - form_keybd and form_button. Both are used internally by
>form_do. I suspect form_button will do the job.

Actually My very sparse AES docs that came with 'Introducing Atari ST
Machine Code' contains both these functions.

By 'background events' I mean exactly what using wind_set and
wf_bevent allow, being able to interact with buttons/sliders etc even
though they are not in the currently topped window.

>Very unlikely. I suspect you've tried to simulate form_button's behaviour
>with graf_watchbox, which doesn't work all too well. Normally, for a
>form_do replacement you'd need little more than form_button, form_keybd,

No I've not done that, as I stated originally my problem arises if the
window is not the currently topped one.
The problem with graf_watchbox arose from my attempt to perform
'background events' if the window was not the top one.
The AES blocks until the mouse button is released (something to do
with it sending wm_topped I believe) so that when the graf_watchbox is
reached the program just continues as the mouse button is no longer
held down.

I would post my code except it is part of a general purpose main
program loop due to the way I have implemented non-modal dialogs.
As I'm programming in ASM this code is several 1000 lines long.

I can't remember which is which, but I think that one of them sets STe colours correctly, i.e. from 0-15, while the other one sets it as it is in the hardware, with the LSB at the highest position.

Greetings,

Tomas

hello

can anybody help me with a urgend problem please?

I have a program that i am porting to PC. But there is a file, that
i cant read correctly on the pc. The program was written in pascal, and
I only must read this file and write the contents to a textfile.

I would send the source of the binary file, and the sourcecode to convert
the file on the atari.
The file is a binary file which is opended as file of real (atari pascal)
.

please mail me back, if you could help me.

with best regards
hermann.

Unfortunately, this was not the case with most generally available
english documentation. To be fair, there is mention of them in Compute's
AES book but ...

The wording leaves you wondering if the functions even exist under any
particular gem.

There are no examples.

You are told the binding will not exist in your compiler and you need to

add it yourself in assembler with not even a vague hint how this is
accomplished.

c'est la vie! ;-)

Are you 100% sure background events are enabled?

>   My original question was to do with clicks on untopped windows
>   inquiring whether or not it was possible to recognise these clicks
>   without the AES blocking until the mouse button was released due to
>
>   the AES sending wm_topped.
>

When background events are enabled you have to click on the window's menubar to top the window (and you will get WM_TOPPED). Clicking elsewhere in the window will return you the MU_BUTTON event and you will not receive WM_TOPPED. If you are receiving it still then background events are not enabled.

> I don't know if that makes sense to anyone but its the best way I can
> think of to describe what is happening.
>

If memory serves, there's another problem when the background object is partially obscured by another window on top of it - graf_watchbox draws the whole object not just the parts of the object which are visible under the window on top. You need to call your redraw routine so that it gets selected and unselected properly so the window on top does not get drawn over.

I would have expected magic to do this automatically but it didn't. If it can do it, then I somehow stopped it. Comments from anybody who knows please?

Does your compiler implement them? If not, you can add them.

Ahaaa, this is what you mean. Well, here you just have bad luck. This is the philosophy of GEM. A window in the background won't see ANY mouse action, it only gets a TOPPED message when someone clicks into it. Of course the message isn't send before the user releases the mouse button; per definitionem an action under GEM is initiated when the button is *released*. It is all the same with clicking buttons, window closer or fuller, menu entries etc. Later people invented the BEVENT attribute, but you seem to not like it, as you wrote in your original message :

> Is there any way to implement background events with out using
> wf_bevent and wind_set()?

I can only recommend to use BEVENT for this ! If it conflicts with something else you wanna do, then it's bad luck, it won't work in any other way (well, at least not in a multitasking friendly manner - you can always use wind_update (BEG_MCTRL) and do all the mouse stuff by yourself).

Cheers Peter

What is it for ?

1) Several modern AES let you operate the sliders of non-topped windows
   anyway !

2) If the window manager in your AES doesn't do it, then there is nothing
   an application can do about it in any sensible way. The only solution
   would be replacing significant parts of the AES.

If you talk about interaction with objects in the working area of a non-
topped window (objects you must redraw yourself in your application), then
of course the AES won't do that. But then WF_BEVENT is precisely what you
need !

> I would post my code except it is part of a general purpose main
> program loop due to the way I have implemented non-modal dialogs.

Note non-modal dialogs does NOT mean they must be operable even if their
window is in the background ! It is usually the better solution to just
let them alone if in the background, and require the user to top them if
he wants to play with them.

Cheers Peter

I have some First Word files on my 1040 ST and need to convert
them to move to a Mac and use MS Word. Is there a conversion
program I can download off the net (preferably), or maybe
purchase (ick!!!).

and so on...

I think that the question is a "double question". If you want to let
thinks running in background, that's one question. If you want to detect
action on button located in forms which are inside untopped windows,
that's another question.
Let start with the first one:
Each time you call an AES function, the AES take the hand. It just take
a look at all other GEM applications (eg ACC) and give them the hand.
That means that you call Rsrc_Gaddr() so you jump into this function,
but the AES exit from Evn_Multi() previously called by an ACC (for
exampl). The ACC calls Form_Keyboard() and the AES exit from you
Rsrc_Gaddr(). So, you run if other applications also call AES. That's
called "cooperative multitasking", because if my ACC go into a pure ASM
loop, it don't call anymore the AES and my APP don't have the "hand".
In old TOS, some functions were "stopping function". In fact, calling an
alert box in an ACC stopped the other GEM APP. It's not yet true
actually with TOS 4. You can try that: build a short ACC with a small

evnt_Timer() and each 2 seconds, print A, then B, then C.... on the top
left corner of the screen, using Gemdos and VT52. You'll see the
printing occuring even if an APP open an alert box.
So, to let background running, you don't have to do special think.

The second question is about clicking on untopped windows. It depend
also on AES version, specially for double clicking. It work perfectly on
a FALCON but not on a ST: you don't get double clic but lonely clic or
no click at all. You can perfom that, using Evnt_Multi with a click
detection: while a click is detected, ask Wind_Find() to get the Handle
of the clicked window. Dont' forget to check handle 0 (the background of
the screen). If it's your window, perform an Obj_Find() to get the
object number. Then perform a Form_Button() to let the AES driving
correctly radio button. If you want to use slider, or editable field,
don't forget to use the clipping. The best way to perform editable field
is to enter a classical form_do function, and set the editable field as
a exit/default button, from which the user will exit using RETURN.
Note: just after your evnt_multi() call you check the kind of evnt that
happened: if you don't want the window to be topped, you just have to
peform first the clic, then the message and just forget the message.

I hope this will light your lantern.

regards

It depend on the machine, because in a hardware point of vue, a ST a TT
and a Falcon don't use the same system for driving the serial port...

If you read the original post you would have seen that I mentioned
wind_set() using wf_bevent, which is how to enable clicking on objects
in untopped windows with the correct AES version of course. The
original question was could this be simulated without using the
wind_set call.
I may not have made this clear though.

The part about graf_watchbox arose from the effect my attempt to
simulate the wind_set effect caused:

1) click on object in untopped window
2) object selects and redraws
3) system freezes until mouse button released: even if mouse moved

outside of the object it does not deselect, as it should as
graf_watchbox is suposed to be called.

I was only trying to describe what was happening here, not saying that
graf_watchbox wasn't working.

>no click at all. You can perfom that, using Evnt_Multi with a click
>detection: while a click is detected, ask Wind_Find() to get the Handle

>correctly radio button.

Yes I do all of that (except using form_button, I just check the
object flags to identify what to do with the object and act upon it
with my own code)

>happened: if you don't want the window to be topped, you just have to
>peform first the clic, then the message and just forget the message.

Yes but the system freezes until the click is released and as such the
call to graf_watchbox just 'flows' through as the button is no longer
held down. Unless wind_set has been called using wf_bevent, in which
case the problem does not arise as the AES does not bother to send the
wm_topped and so the system does not freeze.

I don't know why the system freezes until the click is released as all
the AES is doing is sending the wm_topped message to my program.

I have now been experimenting and it doesn't matter what I attempt to do
after the click has been registered it does not perform until the button
is released, this is despite calling evnt_multi with the number of clicks
to $103, the button to click as 3 and the button state as $103.

Well since I program in assembly then a compiler has nothing to do
with it ;-)

Thanks to everyone who has replied to my less than clear question.

No it doesn't conflict just the reason above.

Hello everybody,

I thought I had this SETCOLOR/VSETCOLOR problem figured out, thanks to the many replies I recieved from the loyal atari programmers/posters here. However, everything was working fine until I filled the screen with the ARECT command in GFA BASIC 3.5E. Heres the code I'm using....

```
' *** my standard-colors for Medium resolution
'
VSETCOLOR 0,0,0,0              !Background            (BLACK)
VSETCOLOR 1,9,9,9              !Printed Text          (WHITE)
VSETCOLOR 2,0,9,0              !Other Text color      (GREEN)
VSETCOLOR 3,2,0,5              !Fill Colors           (DEEP BLUE)
```

```
black=0
white=1                        !Set the appropriate color numbers
green=2                        !with the appropriate color varible
blue=3
```

These are the only colors I'll bee using in my program. Blue for boxes/screen fills white and green for text, and black for background (border).

When displaying a filled box on the screen such as PBOX x1,y1,x2,y2 and using the DEFFILL blue,2,5, the colors are fine. The box comes out blue. on a black background.

Now the problem. In another procedure I use the ARECT command to fill the screen. This eliminates the closed box lines when using PBOX. However, the colors do not work proper as withthe PBOX, DEFFILL command. Here's the procedure...

```
PROCEDURE fill_screen
  CLS                                            !Clears the screen
  GRAPHMODE 0                                    !Replace mode
  pattern%=&X10001000100010           !My pattern for the fill (Anyone
                                       know how to do this better?)
  z%=V:pattern%                       !Find the patterns address
  ACLIP 1,0,0,scrn.x.max,scrn.y.max           !Clip the screen
  ARECT 0,0,scrn.x.max,scrn.y.max,blue,0,z%,1 !Fill the screen in BLUE
  ACLIP 0,0,0,scrn.x.max,scrn.y.max           !Clip it again
  END                                 !END because I don't move on unitl
                                       I've solved the problem
RETURN
```

The problem is, The screen gets filled with the pattern, but in white, not blue!, Whats the problem? I've defined the color to be blue, so why does the computer assume white?

Please help? Also if anyone has a better routine of doing this and wouldn't mind sharing, I'd be more than happy to accept :)

Scott.

Hi!

In article <EF67Lz.MIK@suse.modem.stud.uni-hannover.de>,
perot@suse.modem.stud.uni-hannover.de (Peter Rottengatter) writes:
> I can only recommend to use BEVENT for this ! If it conflicts with something
> else you wanna do, then it's bad luck, it won't work in any other way (well,
> at least not in a multitasking friendly manner - you can always use wind_update
> (BEG_MCTRL) and do all the mouse stuff by yourself).
Another possibility would be to use one thing AES has offered from the
first version to the latest: You can operate in background windows when
you hold the right mouse button pressed. That means, to select an item in
a background window, hold down the right button and then click onto the
left one.

There's nothing special to be done for this to work, a usual evnt_multi()
loop which waits for left-button-presses will do. After receiving a click
event, simply call wind_find() to get the handle of the window the click
was directed to.

This method may be a bit inconvenient for the user, but has the advantage
that it works with all AESes, whereas WF_BEVENT is a new window option
which is not present in AES < 3.30 (unless you are using WINX).

Ciao

Thomas

I'm not certian on this, but it may work. There is a shareware program for atari called MARCEL. This word processor can save text/docs in many formats, RTF, First word plus e.t.c. Perhaps you could download a copy of this program and load your file into it. You can then save it in the format required by MS Word. I know it works for word perfiect to wordplus and vesa-versa. I'm not sure of the format MS Word uses to save its docs.

Hope this helps,

Scott.

Yeh but its so much nicer not to have to top the window (and quicker
as well)

I can't help much here except to wonder about the mask. Depending on
what system calls the GFA commands actually make, the mask used can
alter the colour.

Apologies if I'm talking out of my **** ;-)

The Marcel word processor can read 1st word files and will save in
RTF.

Given that I often have to exchange data with customers on Win95,
I was looking for a VFAT.XFS so I could be 100% compatible.

http://www-plateau.cs.berkeley.edu/people/chaffee/vfat.html

Seems to indicate that VFAT has been the default filesystem running
in Linux since quite a while, so I was wondering if there is anyone
competent enough to extract the VFAT routines and create a VFAT.XFS
that could run neatly along MINIX.XFS so that VFAT partitions could
be read/written when needed.

I know very well that MINIX is a *much* better filesystem than VFAT, but compatibility is a key issue here. I make WebPages for a living and often receive logos and images, on ZiP/Jaz or Floppies formatted on VFAT under Win95, so I need to access the longnames, as truncated names aren't good enough.

Additionally, Win95 cannot read/write Minix-formatted floppy or ZiP, so to answer an obvious question, no, Minix isn't good enough. Also, please avoid any replies mentionning Magic; it just isn't compatible with MiNT and MiNTnet, so switching to Magic is out of the question.

Could anyone look into porting the Linux sources?

Thanks! ;-)

   hello, I'm currently working on a textviewer and have got a problem. Now, this is the case; I use evnt_multi to wait for a keypress (evnt_keybd()), and when I get that event and have detemined that the pressed key is an arrow down (scancode $50 or $48, don't remember) I enter my scroll down routine. Now, when this scroll down routine is finished (one line scrolled), I want to check, somehow, to see if that key is still pressed! This way I can loop this scrolling routine which speeds up the scrolling quite much and avoid the keyboard overrun. I've tried to use Bconin(), Cconis() and have messed with the iorec buffer for the keyboard, but haven't managed to do it right. So, I would like to know if there's a legal way of checking if the last key received from the keyboard ACIA was a "make" or a "break" key. Kinda like checking if the mousebuttons are still down by calling graf_mkstate(). Can anyone shed some light on this subject?

The best way to avoid your problem is to make your scroll rout as fast
as the key envent !!! :)

I wouldn't worry too much about that. (obviously ...) The worst is
that BEVENT isn't implemented and the window will be topped first.
Also, lower screen resolutions usually dictate that the window be
topped to see what's going on in any case. ;-)

DIM items%(10,10,10)
FOR x%=1 TO 10
  FOR y%=1 TO 10
    FOR z%=1 TO 10
      items%(x%,y%,z%)=x%*y%+z%
    NEXT z%
  NEXT y%
NEXT x%
```

```
FOR i%=1 TO 10
  PRINT items%(i%,i%,i%)
NEXT i%
END
```

Other examples:

```
DIM array(23), array$(89,12), array!(1000,1000,1000)

OPTION BASE 1
 1st element is array(1)

OPTION BASE 0
 1st element is array(0)

a=DIM?(array())
 highest index of array()

   DIM array$(55)
   PRINT DIM?(array$())
   55
```

Greetings,
  Uwe.

 Hmm?....maybe GFA is different, but surely

DIM ITEMS(10)

 Will produce 11 cells?...0-10

 All my maths use 0

 for loop = 0 to 9

 A=0

 ect...

>   NEXT y%
> NEXT x%
```

An array such as this does not hold 30 pieces of data (as I believe Scott is looking for), but holds 10*10*10 (=1000) pieces of data.

explanation:

```
dim items%(10)
   - creates an 1D array of 10 values.

dim items%(10,10)
   - creates an 2D table of items 10 by 10 square - ie 10 columns and 10 rows

dim items%(10,10,10)
   - creates a 3D cuboid table of data - 10 columns, 10 rows, and 10 deep
```

```
> FOR i%=1 TO 10
>   PRINT items%(i%,i%,i%)
> NEXT i%
```

This little loop will of course only print a small number of the values stored in this array - the diagonal line through the cube starting at 1,1,1 and ending at 10,10,10. To extract the full data needs nested for loops as above.

If you only want to store 3 values for 10 items, then the easiest way to do this is a simple 2D array:

```
dim items%(10,3)

To access value 1 for item 5 use: item%(5,1)
    - so to set the value, use item%(5,1)=45
    - or to use it in something else: x% = 34 * item%(5,1)
To access value 2 for item 5 use: item%(5,2)
To access value 3 for item 5 use: item%(5,3)
To access value 1 for item 6 use: item%(6,1)
etc...
```

BTW. I dont know GFA at all, so I've just used the same syntax as Uwe...
(many languages start array indicies at 0, but I believe GFA defaults to 1)

Hope this helps...

Anthony

Yes, this is a good way, but one is beter : using the keyboard equivalence table fonction. You will find it with the name of :
Keytbl()

If your aim is to watch for menu shortcut, please look directly in the ressource menu, so when you change it, it steel works. So you can translate shortcut as well...
Good luck !

Can you imagine what I mean with:

>OPTION BASE 1
> 1st element is array(1)
>
>OPTION BASE 0
> 1st element is array(0)

As you see, you can set the index value for the first element to 0 or 1.

Greetings,
  Uwe.

Correct. It's just a simple test for me, I've not used GFA for 3 years.
The output of these 3 lines shows me, that all was functioning as aspected.

>BTW. I dont know GFA at all, so I've just used the same syntax as Uwe...
>(many languages start array indicies at 0, but I believe GFA defaults to 1)

You can set the start index using

```
 OPTION BASE <value>
```

with value = 0 or 1

This will set/change the start index for all arrays in the hole program.

BTW: The extension % of all variables in my listing stands for 4 long int.

```
     Other types are:
     !   boolean     (1 byte)
     |   signed byte (1 byte)
     &   signed word (2 byte)
     %   signed long (4 byte)
     #   float       (8 byte)             This is the default type!
     $   String      (up to 32767 byte)

     So a!, a|, a&, a%, a# (or just a) and a$ are 6 different variables!
```

Greetings,
  Uwe.

Strange. If you want to display a box, the best way is to draw it under
a RSC editor so to have this box as a form. After that under your RSC
editor, you put a string in this form and that's all.

Regards

Sometime ago I asked the following question:

If I have a window with lines of text in it, how do I reverse image a particular line as in an editor when you drag the mouse to copy a block.

Someone kindly posted some example code and I think it was to do with vro_cpyfm(?).

Now that I have time to try it, I have lost the relevant articles, due to a crash sometime ago :(

Could someone please tell me how I can do this?

TIA,
Gary

CompuServe is closing all their Atari forums at the end of this week.
Usenet members, please welcome the former CompuServe users and help them
get into the swing of things with Usenet.
Thanks.

Yep that's the one. I figured it out after. I realized all I need was to find the amount of space between to two coordinates, and use that to find the center for the text. Thanks anyhow. However there's another one I've been working on. My program will be reading alot of files. Some of these may get quite lengthy. I want to put a status box on the screen which displays the amount of file read wiht a bar (PBOX). How do I go about converting that.

Eg.

Say I have a file of 9000 bytes, the status bar has 400 pixels and is centered on the screen in a box. How do I go about making the status bar move, or grow according to the amount of data read in, so it ends on the 400th pixel accurately. Such as the the ones displayed when formating disks and stuff. I know how to make the growing bar, but notso its accurate with the file being read in. Math was never my strong point. Once division was introduced in elementary school, the world became a very confusing place :)

Scott.

Subject: STFM & memory above the 4 MByte limit.
Date: 1997/08/29
Message-ID: <5u6124$71e@bcrkh13.bnr.ca>#1/1
X-Deja-AN: 268892347
Organization: Nortel Ireland Ltd
Newsgroups: comp.sys.atari.programmer,comp.sys.atari.st.tech

I am posting this to the two groups as it's relevant to both.

I modified a 1/2 MByte STFM to 4 Megs using a 8 MByte 72 pin SIMM.
This works because the 8 MByte SIMM has the same number of address lines as

the STFM MMU. It has two more RAS lines, but I just tied these 'high'.

So now I had a 4 MByte STFM & it works really well. I find it's more reliable than my Marpet Xtra ram board

I wondered if there was some way to use the upper 4 MBytes on the SIMM.
I wanted to use the STFM's MMU to access it because it seemed the easiest way (less wiring on the motherboard & it's cheaper).

AFAIK, there is no hardware in the STFM with the address range $400000 to $C000000. Read/writes to this area cause bus errors, generated by the GLUE chip. It's fairly easy to decode all or some of this range, so I decoded an extra 4 MBytes.

Because the ST's MMU only has 2 RAS lines, I expanded these with some more logic & the address decoder to generate a total of 4 RAS lines. It seems possible to generate more, i.e.. 8 MBytes also looks do-able, but all I want right now is the extra 4 MBytes.

So, I built this into the STFM & I can now access memory from $400000 through $7FFFFF. This only works because the memory bank configuration for the 'lower' 4 MBytes is the same as the 'upper' 4 MBytes. In reality, the MMU only really knows about the 'lower' 4 MBytes.

I still have some hardware bugs to iron out, but right away I see some other OS related problems.

I am using TOS 1.04, & it does not appear to like memory above the 4 MByte limit. It sets PHYSTOP to less than 4 MBytes, around 3.2 MBytes.

This may be a consequence of failing the ST's memory test, where $400000 is supposed to be the first unreadable location . I have manually reset this to $400000 & also set the ramtop to $3F8000. When I do the memory test, all 4 MBytes are found.

I have tried a few programs to see if they would detect this extra memory.

Sysinfo finds it , it reports $800000 of ST memory. I though that any memory above $400000 was called TT ram. Sysinfo complains that ST RAM is invalid because it's too high. Sysinfo finds 0 TT RAM.

Memtest also finds the extra memory, it also reports 8 MBytes of ST memory.

Manually setting the ramtop is not really good enough, as the OS still won't use it, so how do you reset all required memory structures so that the extra memory is found? I don't know how to fix this right now.

Also, the screen memory is still set below the 4 MByte limit, the MMU is not able to directly address the 'upper' 4 MBytes. I may be able to fix this later, but I could live with the screen set between $3F8000 & $$00000, as long as the OS can handle two large pools of memory.

I have not tried MiNT, but I was told that MiNT may be able to detect & use

this memory right away. Is this true?

AFAIK, TOS 2.06 may be able to address this memory, I remember the Marpet expansion board board (8 MByte extra) needed TOS 2.06.

Has anybody else done anything like this?

Hey, that's bl**dy clever of you, Gerry. You must write it up so that others can have a go.

I did something like this myself using a circuit by ????? (forget now). The purpose of this was to be able to use an extra memory bank so that you ended up with a "3Mb ST" (many people found they had a spare memory board after swapping early 512Kb expansions for later 2Mb

ones) - ong story.

I couldn't get it to work on my STM as the circuit introduced a delay
which was just too long to be accommodated by the 120ns chips.

>AFAIK, TOS 2.06 may be able to address this memory, I remember the Marpet
>expansion board board (8 MByte extra) needed TOS 2.06.
>
>Has anybody else done anything like this?

Yes, this could be a worry. A lot of intimate software could well be
coded on the 4Mb assumption. Not that it was wrong to make this
assumption - you just have to count the address lines. They just
didn't reckon on a crafty bu**er like you to extend the address space.

I see that AiXit are selling RAM extensions over 4Mb. I think this
should give you some confidence as they wouldn't be doing this if it
meant using totally new OS. Why not ask them how they do it?

  Seeing as much of the software from "those days" exists only on CIS and
other such services, is anyone doing anything to protect this?

Maury

The UMich 8-bit Atari Archive has a chunk of the CIS archives archived
away. I need to sort through it, though. Anyone willing to help?

Oh sure. If you could answer some tricky Atari programming problem, I could empty my wallet!! Get a life!! Beats asking for money to buy a cup of tea I suppose :(((

BTW, I could do with a new video and one of those Porche's, if anyone's feeling generous???

The Profi-Buch is still more comprehensible. I at least use it much more than the Compendium. But it's not english ...

Taken from a GEMDOS techincal doc...

JR.

EXECUTABLE FILES

An executable file consists of a header followed by images for the text and data segments, zero or more symbol table entries, a fixup offset, and zero or more fixup records:

Executable File Parts

```
 ___________________
|    file header   |
|__________________|
|                  |
|   text segment   |
|                  |
|__________________|
|   data segment   |
|__________________|
|      symbols     |
|                  |
|__________________|
| fixup information|
|__________________|
```

The file header contains a "magic" number (a signature to indicate that it is an executable file) and several long-words containing size information:

Executable File Header

Offset	Size	Description	
0x00	word	0x601A (magic number)	
0x02	long	Size of text segment	
0x06	long	Size of data segment	
0x0A	long	Size of BSS segment	
0x0E	long	Size of symbol table	
0x12	long	(reserved)	
0x16	long	(reserved)	
0x1A	word	(reserved)	
0x1C		(start of text segment)	

The text and data segment images immediately follow the header. The symbol table, if there is one, follows the data segment.

GEMDOS will "fix up" a longword in the text or data segments by adding the base of the text segment to the value already in the longword. The fixup list specifies which longwords need to be relocated. The first item in the fixup list is a longword specifying the offset of the first fixup;

the longword is NULL (0L) if there are no fixups. Single bytes following the longword specify offsets to more fixups. The longwords must start on word boundaries, or the system will crash.

Relocation Bytes

Byte	Description
0	end of relocation information
1	advance 254 bytes, get next byte
2, 4, .. 254	fixup longword at location pointer
3, 5, .. 255	(odd numbers, reserved for future use)

SYMBOL TABLE

The symbol table consists of symbol-table entries, formatted as:

Symbol Table Entry

8 bytes symbol name
WORD symbol type
LONG symbol value

<<<explain about symbol types here. It's really pretty simple...>>>

Values for Symbol Types

Type	Value
defined	0x8000
equated	0x4000
global	0x2000
equated register	0x1000
external reference	0x0800
data based relocatable	0x0400
text based relocatable	0x0200
BSS based relocatable	0x0100

They are user flags and maybe used to extend GEM, you will of course
have to
write the routines to deal with the extra flags.

Heat & Serve C is probably the best PD offering around. It is CLI
operated
but it shouldn't be a problem. I would recommend the Everest text editor
for
entering your programs.

You were told in an earlier statement in other news groups to sell
your computer (or your wife to be). seems a sensible solution to me,
or you could try hitching a lift - though if Canada is as dangerous a
place as America promotes itself to be, I wouldn't take that option.
Sell your computer

After 36+ Months of Intense Labor our Over Due Baby/Rev. 10 Best
Electronics All Atari Parts/Reference Catalog has Arrived.
This New Rev. 10 version Catalog/Atari Reference Manual is Over 4
Times the size of our last catalog (June 1991) and has Many
Interesting New Features! Just to Tickle your interest here are just
some of the Features: A Catalog Index!, Easy to find Item/Product
format, 55+ Best Technical/Repair Tips covering ST, 8 Bit and 2600 5200/7800
Atari Products, 90+ Best Informative Information Tips, Over 330+ Pictures of Atari
products (last catalog had 137 pictures), Over 2000+ New Atari part Numbers/
Products,
Expanded Listing and Descriptions of 8 bit Software Titles, An Atari Memorabilia
Picture Museum and Complete Atari I/O Connector Specifications on just about

every Atari product made! As we start an Unprecedented 15th Year in the Atari Computer Parts business, Our New fully Computerized Accounting
System has had all of the bugs worked out, so each customer will Now have a
 Unique Customer Number for easy Item Inquiries, Order Processing, Invoicing also we can efficiently Track our 4,000+ Line Item Inventory! The Unique Best Catalog which is Now Shipped World Wide to Atari end users and Dealers alike, is priced at $7.50 (Actual Cost to Produce only) (California residents must add your local 7.25% (.54), 7.375% (.55), 7.50% (.56), 7.75% (.58), 8.25% (.62) or 8.50%
(.64) cents sales tax to the total and $3.00 U.S. Priority Mailing. So if you would
like to get a hold of a Hot off the press copy of our catalog, just
send a check to

Best Electronics,

comp.sys.atari.programmer,comp.sys.be.programmer,comp.sys.mac.programmer.misc,comp
.sys.newton.programmer,comp.sys.next.programmer,comp.unix.programmer

Hi there,

after some time registering that every/some people have a "Tamagochi" I
think about writing a "real" virtual Pet Software on the Macintosh and PC.
I discussed with my girlfriend this idea and noted some of the specs I want
to implement into my App. If you want to add, delete, help or discuss
something, I would appreciate it :-)
I can write the Mac and PC Versions but every help and/or support is
welcome :-)

Now a draft of the specs and Ideas I have for my virtual Pet APP:

Name: CyberPet or CyberBoz
Systems: Macintosh, Windows, Amiga, Newton
Shareware or Freeware concept.

Basic specs:

One-Window based Application which is the Home of the vPet. The Background Image can be changed to different ambients.
The real basic is that every App is able to interprete a DNA structure which must be defined (see "The DNA format").

1.) There is a Bed, Kittchen, Playground, Office and a Door.
There are some options in the Window you can click on. With this functions you can interact with your vPet. You can play with him, give food, give Books aso. It could be also thinkable that you can buy thinks like Magazines or Food for your vPet. This must be made in a virtual Supermarket - but is another Idea.

2.) Menu "Pet" point named "wants to Travel" (DNA Export)
If you select the Travel Menue in the App the vPet leave through the door and you must select "want to come" to reload it. Is also possible to beam the vPet via Infrared from one Device to another (in the Newton App). From now on you can take this file with you on a Disk or send it via Internet to somebody else - your vPet is Traveling.
My Idea is that the vPet can travel from one App to another App. This should be not limited to one Plattform and work in form of a DNA export structure.
With this option you can take your vPet with you to work or to a friend. The vPet can visit the vPet from you Friend or Girlfriend.
If a external vPet is visiting your vPet in your App there is a chance that you get new vPets with a mixed DNA. But there must be a Male and Female vPet and they have to fall in love. Most of this functions and procedures are RND type and you must have luck to get children vPet out :-) Number and sex of these childrens are also RND.

3.) The DNA format
I'm not sure about all the things I want to store inside the DNA. First of all the age of the vPet. I'm also not sure about the source of the first vPet - is there a egg coming with the App like in Creatures or is there only the App and you must find a baby vPet somewhere. (It's also possible that I send you your first DNA by eMail if you are a "good" guy :-)) In addition to the age there is the sex type, height, weight, eyecolor, haircolor, feetsize and some character specs which handle the control of the vPet. It must be like this: If you feed your vPet twice and it decide to eat, it must become bigger and heavier. Next Day it eat more than before RND controlled. So there could be big and small vPet's and many types of children variations. The same with the intelligence: If you buy magazines and books for your vPet it become more intelligent like a other vPet without these gifts ... and so on ... it is as I said, most of these variations are RND controlled and can be extended in future releases. This is also a major spec in the DNA format that it is upgradeable and downcompatible. Here is also the most room for your suggestions and ideas.

I want to have a open discussion about this Idea. Could be great to have all over the World vPets and your vPet can Travel and learn about other cultures. I dont know how to implement this things, but I have many Ideas ..
I need also Help from programmers for the Newton App. I plan to publish the DNA specs free and everyone who wants to write vApps like vHospital,

vSupermarkets, vFitness and vSport Apps is welcome :-)
Is also planed that vPets can cary messages for specific vPets (friends) and there is also a possibility to have a vMarketplace somewhere in the Net. This Idea combines the virtual Identity Idea and the Tamagochi Idea. I need general help from graphic freaks and specific help from coders for the Amiga Version.

So, the discussion is opened - hope somebody react positiv on this Idea ?! :-)

Regards ...

Frank

Katherine L Ellis <kellis@primenet.com> wrote:-

>3) If I move the RSC, (thus the window), do I need to only think about
>the window? or the RSC too with a OBJC_DRAW?
>I mean. is just a wind_set enough? or is OBJC_draw necessary over it?

You do not need to use objc_draw(), just the wind_set().
If a redraw is needed the AES will send a wm_redraw message.
You will however need to update the x,y coordinates of the root object or else the AES will think the objects are still at their old positions. Use wind_get() to find the window work area coordinates to get these.

>4) I have my RSC tree with border outlined 2 point interior, sometimes
>it doesn't redraw correctly the border, If I was using a background

>without border it would be fine.

It would be fine without the border. I have the same problem with
borders though.

>5) I have an object (icon with selected), I would like that when I
>click on it, it woul display it but selected, so far it works fine but
>don't know how to redraw this area only coz the icon. So If I refresh
>teh whole screen it would change state(visually)..

Simple. Find the x,y screen coordinates using objc_offset() then find
the objects width and height and simple restrict the object draw to
this area. You will also need to allow for any border the object has.

David

Will this be completely different from Creatures, Dogz, or Catz , which
sound just like this idea ?

I recieved many eMails regarding my Idea. Many thanks for that. Here now
the first update of the Projekt:

Name: CyberPet or CyberBoz
Systems: Macintosh, Windows, Amiga, Newton, Psion?
Shareware or Freeware concept.
Project state: Concept
Project leader: frank.blechschmitt@bluewin.ch

Update 0.1

IF YOU WANT TO HELP IN THIS PROJECT SEND ME A eMAIL! I ADD YOUR NAME IN THE
PROGRAMMERS LIST
AND I WILL CONTACT YOU IF THE DEVELOPMENT STARTS. YOU WILL RECEIVE THE vPET
SDK KIT FREE WITH
ALL INFORMATIONS AND FORMAT DESCRIPTIONS. vPET IS YOUR APPLICATION!

to Basic specs:
I forgott to say that vPet is a game charactered App. Even if there some
functions which points to a economic simulation App it should be a GAME !
But the simulation effect is automaticly coming if the vPet is RND
controlled :-)
More and more i get the impression that this project would be a great game
also for childrens. They can learn how to handle with money, how important
is health and who to find friends and a partner. The vPet can smoke but
then it reduce the health status :-)

to 1.) The possible Playgrounds for the vPet

A idea from Daire Garvey is to have your vPet on your webpage in a Java
applet. Sounds good but then it must make a sence if the vPet is there.
Lets play with the Idea: If you transfer the DNA to a vPet Server there
must be a possible function for the vPet like searching for a partner or
collecting informations. A thinkable way could be to have defined
categories like "Go shopping", "do Sport", "make Hollidays", "search a
partner" etc. Inside this categories the vPet have a order; like "buy
food". If now a other vPet has the needed information or the needed product
your vPet is buying/recieving it and stores it in the order field. If now
the vPet returns to home it puts the food into the refridgerator and
communicate it to you. If the order was to make Holliday and he returns the
DNA is modified and the life quality standart is increased or decreased.

This adds the question to the project if we need vMoney. How do the vPet pay for Holiday or in the Supermarket ? How do you buy Books for it ? But if we add vMoney we need a vBank, vCreditkard etc ... :-)

We can solve this problem if we have a function implemented that give us the possibility to spend our vPet every Month some pocket money and the vPet stores it in the DNA.pocket_money or put it on a vBank. The DNA.bank_number var is important if your vPet wants to buy something on Credit somewhere. If somebody wants to create a vBank he must register it and receive a bank_number.

But first we must think on the makeable things. I must shrink the possible interactions in the first release because i dont have the time to implement all ideas :-)

to 3.) The vDNA format - VPTP (Virtual Pet Transfer Protocol)

Ok, the vDNA format is now the major interrest. I think that the numbers of variables must
be expandable for future updates. But to limit the size of the possible vars there must be variable field list with a value range header. That means that there must be libraries (vDNS) which hold the value ranges and there description. The vDNA only represent numbers which access the values inside the vDNS. Is like in real life - there are many combinations possible with only 4 values. Every vDNS has a unique Number which is generated by the main App. The unique part is controlled by the user registration which gives various numbers. Every vPet is registered and everybody can check the popullation state in the web.
The registration of your vPet is FREE! Is only to handle the statistics. It could be very interesting to see how many vPets still life and how many are death. If a vPet dies it must be also registered and the name is deleted in the main registry. Btw, it's also thinkable to build vCommunities and vCountries. Functions of these Instances could be to define the life conditions. The life conditions help to handle the DNA.health_state. But this is a future point :-)

Example:

```
     def type format
          current_feeling (0,1) as integer
          current_actualtime as time (stores the export time if the vPet is going
to travel)
          age_birthdate as date
          height_cm as byte
          weight_kg as byte
          sex_type as bolean (true=male, false=female)
          health_state (0,1) as integer
          eye_color as byte
          hair_color as byte
          feet_size as byte
          pocket_money
          bank_number
          ...
          character_specs as ??? (still thinking about this point)
```

```
        ...
    end type

    dim vDNA as type format
```

Settings:

```
    vDNA.current_feeling(0,0) = 1 rem first position of the value range of the
feeling DNS which can be from -10 to 10.
    vDNA.current_feeling(0,1) = 5 rem the 5 is the used value
```

The benefit of this methode is:
If we want to extend the possible combinations we can expand the value range inside the DNS library 1.

3.1) NEW - The vDNS format

The vDNS Library format is a list of value ranges and their format. The vDNS is handled by the main App and is not transfered. Only a way to update the vDNS must be there.

Example:

```
    def type format
        description as string * 30
        range (1) as integer
    end type

    dim vDNS (x) as format

    vDNS.description = "Feeling state"
    vDNS.range(0) = -10
    vDNS.range(1) = 10
```

Something like this should give us a max. of variations. I'm not sure if we should use the description only as description or also as a identifier for a interpreter. I mean, if a other Version of the DNS Library has a other value range in position 1 it must be possible to search inside the field for the Feeling state.

> 1) I need to have a window behind any RSC tree I want to display.
> Otherwise in multitasking, it won't be recognized. Normal?

You can use the following method instead of a window (though a window is better):

```
  wind_update(BEG_UPDATE);
  wind_update(BEG_MCTRL);
  form_dial(FMD_START...);
  objc_draw(...);
  form_do(...);
```

Then, when you're done handling form_do() results...

```
  wind_update(END_MCTRL);
  wind_update(END_UPDATE);
  form_dial(FMD_FINISH...);
```

> 2) Is the LASTOB flag really necessary?

Yes. Atari's AES requires it when dealing with EDITABLE objects. If you leave it out, some versions of the AES will crash when you press Tab while the edit cursor is on the last editable object in the tree. Most resource editors handle the setting of this flag for you automatically.

Since you havn't put "Acorn" on that list could you possibly refrain from
posting to c.s.acorn.p please?

I have released a Pure C/Lattice C source library to replace
form_do() etc. with windowed versions. I believe you can download
it from Rick Teitjen's web page - teleport.com/~atari or something
like that.

(Unfortunately, I used the same name as a similar Sorbozon C source
library, so giving you the filename would probably cause confusion.)

Amiga is dead and Psion is something I heard of only once.

Since you do not seem to consider including Unix/X Window System
platforms, could you please take your thread out of
comp.unix.programmer?

Thank you. [followups set appropriately]

I think it would be a good (better?) idea to mimic real life and make
the "DNA" part only store the characteristics and instincts of the
creature, not stuff like age, etc which is a parameter of the individual
body that the DNA resides in. As well as allowing the pet itself to
travel, why not facilitate the meeting between two pets to produce
offspring with a combination of the parent's DNA. If you also allow for
DNA "mutation" (i.e. random copying errors) then you'll have the basis
for natural selection to take place. The selection will work
automatically by the appeal of the vPet to a particular user- "nice"
vPets will tend to succeed where "nasty" or useless ones won't. After a
time the vpets will take on a life of their own and "evolve" in
unexpected and astonishing directions. Obviously to do this the basic
protocols for turning the DNA into a body (phenotype) need to be
established and based on very simple rules. The first vPets may be
rather unsophisticated and perhaps virus-like, but eventually more
interesting ones will arise.

Go to it!

If you're interessed, why not asking to add acorn to the list instead !

Atari XL is an 8-bit system!!! It is based on 6502 processor... Similair
to this used in Commodore 64. There're still quite a lot ppl who code
demos on it (especially in Poland). One week ago there was an Atari
party in Poland (called: Orneta'97 or QuaST'97 party) where 7 demos &
15 intros was shown for competition. Those demos included effects like:
- phong shading (two big toruses at once on screen)
- Z-buffering (four Z-buffered pyramids (tetraherdons?))
- real time fractal zoom
- texture mapping on cube
- bump mapping
- gouraud shading on cude
... and so on... if you need more informations about this system, then
post email to: ataripl@piwo.bl.pg.gda.pl (Polish Atari discussion list)

Is there any way to implement background events with out using
wf_bevent and wind_set()?

My attempts to do this do not seem to work. If an object is clicked
on then it is selected but everything freezes until the mouse button
is released (ie not doing the graf_watchbox which is supposed to be
called after the initial click and hold)
I presume this is something to do with the AES sending wm_topped as
the problem does not occur with right clicks.

David

Whereas the ST is a 16-bit machine based around the 68000 processor the
same as the Amiga and early Macs...

(the original poster may not have been aware of this...)

KNOWLEDGE IS POWER. It separates the WINNERS from the LOSERS.
Do you want to be a winner? Do you know what separates the very successful
people from the people just getting by? INFORMATION!!! The MOST
successful people in any field, don't have all the answers... BUT they do
know where to find them. Everyone needs to have information. Children
need it for school, and good grades. Adults need it to keep informed and
current with associates. Don't you know someone that always seems to be
on the inside track? They may have already bought this report. Have ALL the
information you need at your finger tips. I already spent hundreds of hours
searching the internet to find the sites you need, with links to thousands of
other sites.

Here are a few examples: government sites, local and federal. Are you trying
to find someone that owes you money? Do you need to check someone's
background... potential employee, tennant, anyone. Find that lost love or
college buddy. Lookup phone numbers around the block or around the world.
Track down court records. Check someones credit, educational background,
driving or criminal record. Locate military records. Get all the newest games,

try them before you buy them. Find dozens of free offers. Search libraries around the world.

Just about anything you can imagine , can be found on the internet. You just have to know WHERE to look.

Don't wait... your competitors aren't waiting for you!!!

> the problem does not occur with right clicks.
>

It would do if you enabled both buttons. Once you've enabled background events that window will *not* received WM_TOPPED messages. What you get instead, is MU_BUTTON messages. Ideally, you want to be using evnt_multi because it also writes the current mouse co-ordinates which you will need because then you call objc_find to obtain the object index in the tree.

And my form_do uses evnt_multi :-)

The fastest way to really get Pure Pascal (my experience) is either sending money (risky) to their address or buying Pure Pascal during some Atari exhibition.

These programms add features of NVDI (Enhancer) and MagiC (Wdialog) to other TOS systems. That means that programms using off screen bitmaps (NVDI-like) or the MagiC file selector (e.g.) can run on other systems as well. They don't speed up anything. They don't give you the full functionality. They just add what is most sufficient to use programs

needing those extensions.

Some programms can test if they are there and then use them (CAB e.g. uses off schreen bitmaps to display animated giffs without flickering. without enhancer (or NVDI) these will flicker). Others won't run without them (well they also test if the extension is there, but break if this is not the case). An example for these is GEMJIG. It uses WDIALOG (don't ask me what for).

I don't think they need a special order in the auto folder. I load WDIALOG from the GEM.CNF (Multitos; still had no money to upgrade to N.AES); Enhancer I don't need since I have NVDI.

AFAIK Enhancer just adds off schreen bitmaps to the VDI. No speed up; No GDOS (this means no printer drivers and no vector fonts, etc.). I think it is better to get NVDI (it is really not expensive for what you get from it). WDIALOG doesn't install all MagiC AES extensions, but enough for me to get the programms running. An example is I think the scrollable edit fields. ASH told me that Jieene uses them if they are there and WDIALOG does not implement them. But in most cases it should be sufficient.

A list of programms where I am shure they can at least use the extensions:

- CAB
- GEMJIG
- TEXEL
- ARTWORKS
- PHOENIX
- PAPPILION
- JIEENE
- There was some fontselector implementing the font protokoll using the MagiC fontselector.

Of course there are more, but I am not shure about them.

Christof

OK, Nick!

I tested this .prg, both versions 2.4 & 2.5, but nothing from this
doesn't wonted to work on my Mega4/STe with TOS 2.05 (?!).
I plugged in 8 or may be (don't remember!) 10 (!) mauses from deference
manufacturers to all serial ports (from Modem1 to Serial2), but no one
maus doesn't worked out too.

If your experiments will be more successfully, please, report me about.

At last time, and why coul'd you been to try to reconstructing standard
PC-maus?

Good hunting on mauses!

Hey everyone,

I'm currently writting a program in GFA BASIC 3.5E. I'm using medium resolution. When tinkering witht the colors, I can't seem to figure out how they work(What each index coorsponds to).

Example:

```
SETCOLOR 0,0,0,0  Sets the border to black
SETCOLOR 1,0,0,0  What does this control (TEXT/PRINT/GRAPHICS?)
SETCOLOR 2,0,0,0  What does this control (TEXT/PRINT/GRAPHICS?)
SETCOLOR 3,0,0,0  This is suppose to control the color of PRINTed text
               correct?  Such as SETCOLOR 3,0,0,7 would display
           PRINT "should be blue" in BLUE CORRECT?
```

What's better to use VSETCOLOR or SETCOLOR?

Also anyone know how to print text on the border? Is it possible?

Scott.

Errr, the Printer Dialog is only a part of the WDialog system.

It is a Window system for putting dialogs into windows, the good part
with this one is that,if you have 2 programs that uses it, you only need
1 Wdialog in memory (unlike for example the E-Gem Libraries)

I'm working with WDIALOG and having no luck with it calling the event
handler routine specified in wdlg_create().

So I get a window, but no events posted when I call wdlg_event().

I have re-created the wdlg interface routines with Lattice C instead of the Pure C they were originally written in. It could be a translation problem, or maybe I'm just not understanding the concept.

The docs say the the handler will be called when create (HNDL_INIT) and open (HNDL_OPEN) are called, but I have a fprintf in the routine and it never shows up.

Any ideas?

John

Sorry, I was interrupted numerous times whilst replying and totally lost track. I meant to be more specific.

What I meant was, you don't need graf_watchbox as long as you don't mind clicking on an object and having it selected immediately - that is, no going back. Anyway ...

I wrote my own form_do for pug yonks ago and I also had problems with graf_watchbox (and graf_mkstate for that matter). My own solution was to write a replacement watchbox routine.

However, along with the compendium came two hitherto undocumented functions - form_keybd and form_button. Both are used internally by form_do. I suspect form_button will do the job.

Goody! You'll need it to use form_button. <G>

Hello again;

Many thanks to all who helped me figure out how to use MFP Timer A in a
little Assembly language program I was working on. Now I have a related
question: how do you get data directly from the serial port?

thanks
myeck waters

I believe you should be significantly more specific about what you want
to do here. The term 'background events' can be understood in several ways
causing confusion which I believe has happened here.

>> >> My attempts to do this do not seem to work. If an object is
>> clicked
>> >> on then it is selected but everything freezes until the mouse
>> button
>> >> is released (ie not doing the graf_watchbox which is supposed to be
>>

You really should post the piece of code here that gives you trouble, with
a detailed description what you want to achieve. graf_watchbox works well,
but must be used in the right way.

>> >You don't need graf_watchbox.
>>
>> You do when its part of your own replacement form_do()

Very unlikely. I suspect you've tried to simulate form_button's behaviour
with graf_watchbox, which doesn't work all too well. Normally, for a
form_do replacement you'd need little more than form_button, form_keybd,
objc_find and objc_edit (plus event_multi in some way of course).

> However, along with the compendium came two hitherto undocumented
> functions - form_keybd and form_button. Both are used internally by

No. Both have been documented since early beginning of the Atari ST series.
Here I have the tenth edition of the Profibuch from 1991, and even the first
edition (must have been 87 or so) had the documentation.

>> >because it also writes the current mouse co-ordinates which you will

>>
>> And my form_do uses evnt_multi :-)

It's not possible to do a real form_do replacement without event_multi,
as even for the most basic implementation at least MU_KEYBD and MU_BUTTON

must be watched.

Cheers Peter

> SETCOLOR 2,0,0,0 What does this control (TEXT/PRINT/GRAPHICS?)

I don't have GFA but I would imagine the index maps directly onto the
TOS call of the same name. If this is the case then its probably easiest
to initially describe it in terms of the standard Gem desktop.

setcolor 0 is "desktop white" (pen 0)
setcolor 1 is "desktop red" (pen 1)
setcolor 2 is "desktop green" (pen 2)
setcolor 3 is "desktop black" (pen 3)

For any program, pen 0 is always used for the background colour when
drawing. This includes text because in reality text chars are just

graphic shapes which get copied to the screen. More on this later.

For GEM, "desktop black" is the foreground colour used when drawing. This is pen number 1 in monochrome, pen 3 in medium rez and pen 15 for low rez.

```
> SETCOLOR 3,0,0,0  This is suppose to control the color of PRINTed text
>
>                   correct?  Such as SETCOLOR 3,0,0,7 would display
>                   PRINT "should be blue" in BLUE CORRECT?
```

Yes and no. At the risk of boring you I'll go through it from scratch.

When the hardware wants to draw the screen in medium rez it sees the screen as a load of pixels each of which has been drawn using one of the four pens. As it comes to each pixel it looks what pen was used to draw it then looks up what colour that pen actually is. This happens at least 50 times a second so the moment you change pen 3 from black to blue, *all* the stuff drawn with pen 3 turns blue. If this is what you want then fine. Usually it aint!

If you want to keep the previous black text and have blue text as well you choose a pen which is not being used. You can't use pen 0, or pen 3 so it'll have to be pen 1 or 2 - it doesn't matter which but lets say it's pen 2. Just change the pen 2 colour to blue then print the text using pen 2 instead of the default pen 3.

No doubt there's a GFA command to do this but even if there isn't you can use the VT52 console driver to do it.

```
[esc][b][pen + space]    (foreground pen)
[esc][c][pen + space]    (background pen)
```

My basic is lousy but it should go something like this ...

```
PRINT "this is black"

SETCOLOR 2,0,0,7
PRINT CHR$(27);"b";CHR$(2 + 32);
PRINT "blue if I've not mucked up the semicolons on the print!"

PRINT CHR$(27);"c";CHR$(3 + 32);
PRINT "blue on black"

PRINT CHR$(27);"b";CHR$(3 + 32);
PRINT CHR$(27);"c";CHR$(0 + 32);
PRINT "black on white again"
```

You may have noticed I said initially that the background is always pen 0 so how come [esc][c] is possible. Well, its just an example of (confusing) relative terminology. It's the background colour for text but the text background colour is not tied to the real background colour. The console just uses foreground colour [esc][c] as the text

background.

> What's better to use VSETCOLOR or SETCOLOR?
>

Naturally, I haven't a clue!

> Also anyone know how to print text on the border? Is it possible?
>

Nope & iirc yes, but very hard - interrupts and stuff methinks.

```
[hic!] (I'm gonna regret this) ...

#include <gem.h>
#include "objc.h"
#define  DEF_LIBC_ONLY
#include <libc.h>

static long
slider_lim(ut,uv,up,n)
long ut,
     uv,
     up,
     n;
{long    t;

 up += n;
 up = Max(up,0);
 t = ut - uv;
 t = Max(t,0);
 up = Min(up,t);
 return up;
}

static int
slider_pos(unit_tot,unit_vis,unit_off)
long unit_tot,
     unit_vis,
     unit_off;
{
 return 1000 * unit_off / (unit_tot - unit_vis);
}

static int
slider_siz(unit_tot,unit_vis)
long unit_tot,
     unit_vis;
{int t    =((1000 * unit_vis) / unit_tot);

 return (t > 1000) ? 1000 : t;
}

static int
slunit_pos(unit_tot,unit_vis,slider_pos)
long unit_tot,
     unit_vis,
     slider_pos;
{
 return ((slider_pos + 1) * (unit_tot - unit_vis)) / 1000;
}

long
_ob_slmov(fcp,fcd,ob,slb_obi,slf_obi,vf,ut,uv,up,n)
```

```
void (*fcp)();
char *fcd;
OBJECT   *ob;
int  slb_obi,
     slf_obi;
uint vf;
long ut,
     uv,
     up,
     n;
/*[  long slider_mov(fcp,fcd,ob,slb_obi,slf_obi,vf,ut,uv,up,n)
     void (*fcp)();
     char *fcd;
     OBJECT   *ob;
     int  slb_obi,
          slf_obi;
     uint vf;
     long ut,
          uv,
          up,
          n;
```

This call allows easily implementation of slider bars in dialogues.

```
fcp  user defined finction.
fcd  user defined pointer.
ob   dialogue's object tree.
slb_obi  slider background object index.
slf_obi slider foreground object index.
vf   flag to control slider orientation and other features.
ut   unit total.
uv   unit visible.
up   unit position.
n    number of units by which to increase or decrease.
```

The slider must contain a parent box (slb_obi) in which lies a single child box (slf_obi). Typically slb_obi is the shaded part and slf_obi the white part of the slider although the colour and shading is entirely irrelevent.

To construct a slider which looks like a normal window slider use an IBOX, place a GBUTTON at either end of this for the two arrows and make then TOUCHEXIT. Cover the remainder of the IBOX with a grey shaded GBOX - this is slb_obi. Now cover slb_obi with a white shaded GBOX - this is slf_obi. Make them both TOUCHEXIT also. The construction should match the aes call graf_slidebox() where slf_obi slides within slb_obi.

Mask SL_DIR_HOR into 'vf' if the slider is horizontal otherwise SL_DIR_VER. In those cases where the user clicks on slf_obi also mask in SL_MOV_BAR - this causes sl_mov() to invoke graf_slidebox.

'ut' is some value denoting how many elements exist in the data which corresponds to the window. As an example, if the data were a document then 'ut' would probably contain the current number of lines.

'uv' denotes how many elements of 'ut' can currently be displayed. This equates to the current window size. Using the document example again, if 'uv' were 10 then the display would be able to hold 10 lines.

'up' is the current offset, in elements, of the display from the beginning value of zero. That is, it denotes the portion of the document currently being shown in the display.

'n' is the number of elements by which to adjust 'up'. Thus, passing -1 would scroll up a line, passing 'uv' would scroll down a page. Passing zero is valid.

sl_mov() takes all of 'ut','uv','up','n' into account each time it is called. Thus changes to document size, display size or positioning will be reflected.

'fcp' is ignored if passed as NULL otherwise it should be the address of some user function. This function is called with (fcd,ut,uv,up) as its arguments. 'fcd' can be anything the user desires - except for passing it to 'fcp' sl_mov ignores it. 'fcp' is called after calculations have been made but just before the slider is visually updated. Typically, 'fcp' is the user's function for updating the display associated with the slider. Note that the 'up' passed to 'fcp' will reflect the calculations made in sl_mov but is always the same as the return value from sl_mov. 'fcd' is typically a pointer to a user defined structure to help the 'fcp' function update its display without requiring any recourse to global variable declarations.

How do you detect whether a drive is high density or extra high density?

Once you have ascertained that TOS can handle DSHD or DSED discs/drives,
how do you detect which one [DSHD/DSED] is installed?

I've looked in the cookie jar, and when the _SWI cookie exists, and

switch 7 is on (bit 6 of the cookie value is 'off'), this is supposed to indicate that an enhanced floppy disc controller is available. How can I tell if it is a DSHD or DSED controller?

However, on some versions of TOS (like 3.05 in the TT in front of me), an _FDC cookie doesn't exist, so I am unable to check its value for the highest drive type supported by hardware.

(After a brief hiatus, I've resumed work on my DESKFMT background disc formatter and copier for MultiTOS and need some way of working out the capability of the hardware I'm running on).

(DSHD = Double Sided High Density aka 1.44 meg discs/drives)
(DSED = Double Sided Extra-high Density aka 2.88 meg discs/drives)

This logic is the wrong way round: replace 'less than' than by 'greater than'.
And similarly for the horizontal case.

Hi to All,

As the title sez, I wanna simple C routine to read the joystick, only needs to read port 1, ANSI C. I'musing Prospero C, just outta interest, been trying to get a few old ones working but with no luck. Even though they compile, if I read the port more than once it stalls.

Any help.
Ta.

Ade.

Greetings from 1stfamily,

As we all know unlimited Internet access is $19.95 / month with every major Internet access company. From Netcom to AT&T that price never changed. So what makes us any different when we are also charging $19.95 / month ???

Our Marketing Plan.

Our method is this. Unlimited Internet access for $19.95 per month. If you find our service to be extremely satisfactory, in which we are sure you will, you can refer our service to 10 of your friends and family. If you do , you will get free Unlimited Internet access with your e-mail address for life !

What we offer is this:

* The fastest, clearest Internet access in the world.

* World Wide Internet access in over 110 countries.

* An e-mail account that is also life time free if you refer 10 of your friends and family to using our service.

* America On-line for only $10 / month !

* Much much more that will amaze you !

Our plan is by the year 2005 we will be the world's ONLY Internet service providers. With our technique of offering you life time free Internet access we will be.

Please visit our web site http://www.freeisp.com/ any where from the world to know more about our opportunity and to even get on the wagon before every one else beats you there.

http://www.freeisp.com/

Please forward this message to all of your online friends. Wouldn't you want all of them to get free Internet access ?

Abdul (SPONSOR ID # SAF5197)
Stop paying for Internet access !

There's no way to know for sure what type of drive is installed. All you
can do is try to format a disk and report an error if there is one. Even
the _FDC cookie in 3.06/2.06 relies on a DIP switch setting. I suppose you
could just check the DIP switch and always go by that.

Great...

We've contact them for about 3 months in order to BUY one Pure Pascal.
They have replied "we don't take CB" so we ask them for their number of
bank account to "poor" directly money on it... and we wait, we wait, we
wait... It's incredible!

Newsgroups: comp.sys.atari.programmer

I'm writing a program that is doing hardware scrolling. I want to have a small static area on the screen to keep some status info. The static area can be on the top, or the bottom, or on one of the sides ... though my preferences I think would be 1., bottom, 2. top, and 3. a side.

What are some recommendations of ways to keep a static area? An HBL interrupt? Is there an easy way using hardware scrolling to scroll only a portion of the screen? If so, I don't see how. Any other ideas or recommendations? Some example assembler code would be a great help.

TIA.

What are for bits 8 to 15 of the Object Status Fields that are available under the 'special flags' of Interface RSC Editor? I know that ob_state bits 0-5 are used for object effects (i.e. selected or shadowed), but on various Programming Books (i.e. Compendium) I couldn't find anything on bits 8 thru 15. I have seen around RSCs with interesting effects using special combination of ob_state bits, so I am wondering if it is possible to find around some information on this subject..

I am doing a research paper for an Advanced Technical Writing class in College. My task is to seek out people who still love their Ataris and to show to my class how technology has advanced and affected people who love the old technology. Can you help me?

BTW, I have four complete Atari systems still. One of them is right next to my P100 and P200.

Hi everybody,

Just a little message to inform you that the Visual Assembleur pages
have just change its URL. Now it is :

    http://www.geocities.com/SiliconValley/Bay/1209

Don't forget to signed the Book !

    See you,

So what exactly is it that you want? I mean, how can us remaining Atarians (cream of the crop, BTW!) help you? Just let us know...! <smile>

> around some information on this subject..
>
> Lodovico

hi,
in fact only bits 0 to 5 are used by the system in the OB_STATE
whiteback is rarely useful and is intended to force a white background
for certain objects but is very rarely useful !!!!
the draw3d bit is not checked by the system it's only for compatibility
with old german libraries (?)
the 3d effects are stored in OB_FLAGS !! (not ob_state)
bits 9&10 which are called extended flags in 'interface2' ..
%00 means 'no 3d'
%01 means 3d indicator
%10 means 3d background
%11 means 3d activator
3d background is very useful to get 3d objects that have the right
color in color modes and monochrome modes (it won't appear black)
you must have an hollow fill and a white color for background and
then put 3d background bits and it will always have the right color !!
when an outlined object have the 3d background bits set it appears
with a thick 3d border ...
warning:
3d effect can be obtained even with objects without a frame
for example g_text or g_icon because it's independant of
the frame thickness ..
there is a bug with that under Magic Os that forces you to always
have a frame when you want to have 3d effect...shame...

hope this helps,
DAVID

Right. So if he does kill more than one company, will that make him a
serial (chip) killer? <grin>

I think somebody has suggested a good method to implement exactly 120hz.

If you need any more help just ask.

If the "Atari is dead" person has nothing better to do with his or her
time, than show their jealousy towards the ATARI devotion. Then he or she
should spend some time thinking about how they have bought into the
ideology of the PC. Also with all that time on their hands, perhaps he or
she are the ones sending all the spam to the atari.st news group.

If you have 4Mo or more on Falcon or TT you can use GCC and for the shell
you can use my graphic shell name GCCShell it work well on most system
especially on multitasking as Magic or Multitos, it's in french but there
is an RSC in english. There is too GNUShell you can find it on ftp.

bye
Olivier

Hi Atari programmers,

Does anyone know how to use the resident JPEG DSP decoder from Brainstorm ?
Thanks to send me any doc or sources.

%But pipes, shared memory and signals have the advantage that they work
%without a multitasking AES and can be used by non-GEM-applications as

%well. What's really missing is an Fselect()-mode for evnt_multi() ...

Exactly. And that's the sort of thing I would look for in an AES replacement. What we need to have happen:
All events - keyboard, mouse, button, timer, message - need to be turned into AES messages. Implement AES message pipes using MiNT pipes (or even MiNTnet sockets, for that matter). Provide the descriptor number of the message pipe to the user - preferably in the appl_init results. Then evnt_multi itself just turns into an Fselect call, and you can use Fselect yourself on the message pipe in addition to the other descriptors you're interested in.

No need for an utility, GFA 3.5 can directly load a GFA 2 program if it's saved as ASCII text, and loaded with the "merge" menu function.

Bye! Bruno.

ONLY AVAILABLE IN THE:
U.S.A, VIRGIN ISLANDS, AND PUERTO RICO CANADA*

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax, pager, voice-mail, and cellular numbers and give them your New "Virtual Office" 800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone? Wouldn't it be nice to be able to give everyone just ONE phone number that will find you anywhere you are? Even out of town, or in a restaurant, or even on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!, Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888 Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection, Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web site:
http://www.mynumber.com

* Based on our best priced plan.
* Canada has a higher per minute rate.

WV> Is there a utility to convert gfa 2 to 3.5 out there?

I've never seen a specific utility to make the conversion, but you should be able to find the GFA 2.x interpreter in the public domain. Many BBS's and I'm sure a few internet sites have it online.

Load your program into GFA 2.x, and write it out as an ASCII text file (.LST format). Then, fire up GFA 3.5 and merge the ASCII text file in. Save it back out to GFA 3.5 format if you wish.

I'm not sure what syntax differences there are between the two versions, and the success of the translation will certainly depend on the program. If it uses nothing but simple BASIC commands, you shouldn't have any problems.

Good luck,

Dear Internet user,

If you are paying for your Internet services
then you have not heard about 1stFamily.
We have a marketing method that guarantees
you will not have to pay one dollar to access
the internet.

* You will never again have a busy signal !

* You will always have the fastest access you have ever seen !

* Risidual income for the rest of your life !

* and much much more.

This opportuinty is for YOU to take advantage of !

Do you wish to continue the rest of your life paying $19.95/month to
access the Internet when you can access it for free with

speed and reliability that exceeds the other competitors ???
We did not think so. That is why our company is the best and fastest
growing of it's kind and will soon compete with AT&T and MCI and
all the big companies in providing Internet Service.

For complete information please mailto:sameer@1stfamily.com and
type "More Info" in the subject box.

You will recieve our webpage address where you can get inrolled in
seconds !!

I dunno about putenv() but all you need do is copy the current
environment to a new memory block and add space for your new
variables, then pass the new pointer to Pexec(). The child process
will then see the new environment.

.. for a minimal realloc() implementation, bearing in mind that C may
have grabbed a larger block than originally requested so in cases
where you are realloc'ing slightly larger blocks each time C may not
have to go back to the system for quite some time.

>Correct but not viable for me as there may not be enough memory to
>hold both the new block and the original block in memory at the same

Probably the only brute force solution is to try Malloc'ing a new
block and if it fails dump the old block to disk, free it and try
again. A more subtle method, if possible, would be to use a linked
list of some sort whereby the sample can be spread over fragmented
memory blocks?

It's simply an extension of the standard TOS Mshrink() call. iirc,
pass it a negative value and it attempts to enlarge the block. Without
full documentation on it, it is difficult to do more than speculate
that it is a function used by MagiC internally so that it can resize
the TPA. ie I'm guessing that it is really only useful while MagiC is
singletasking - there seems little point in it allocating a distinct
fresh block and releasing the old as this is possible anyway. ;-)

>Is this call only available under MagiC or does TOS support?

Nope, TOS does not support it. It's a nice idea under MagiC but I doubt it would be of much practical use when you take multitasking into account.

>If TOS does not support this call is there anyway to enlarge a block
>of memory that has already been allocated?

Not really. You'd have to have intimate knowledge of the memory manager and even then you'd be no better off than MagiC - if there's a block allocated in desired space above then you would not be able to extend the block under TOS either.

Boy did I screw that one up! All I can figure is that I mis-translated the 1.0 German docs and never bothered to check the ANSI docs for system(). Even the 1.1 German docs for system() are obviously not about setting environment variables (unless you use SETENV).

OTOH, putenv() is not in the standard library at all. (The reason for this is that the default environment is not expandable.)

The instructions for Pexec() are still good, though.

b > I have no any trace about putenv in my documentation, in my
b > *.h files (PureC1.1) to :(i need Pexec a program with
b > additionnal environnemment!!

The function is system() and is found in stdlib.h along with
getenv(). However, whenever I call system() it crashes. Looking at
the code with the debugger, I see that it uses the _shell_p system
variable, so it probably requires that you install a shell program
for it to work.

There is also an AES call, shel_envrn(), which does the same thing
as getenv().

To SET an environment variable when using Pexec(), simple create a
string consisting of the appropriate environment, such as

```
static char* env = "mypath=C:\\clipbrd\0";
/* Don't forget the extra NULL terminator */
```

then use this pointer in the Pexec() call for the envrionment
pointer.

To ADD an environment variable, copy the entire environment into a
new buffer and append your string to the end (before second NULL in
the double NULL terminator). Or vice verses.

Dear Internet user,

If you are paying for your Internet services then you have not heard about 1stFamily. We have a marketing method that guarantees you will not have to pay one dollar to access the Internet.

* You will never again have a busy signal !

* You will always have the fastest access you have ever seen !

* Residual income for the rest of your life !

* and much much more.

This opportunity is for YOU to take advantage of !

Do you wish to continue the rest of your life paying $19.95/month to access the Internet when you can access it for free with speed and reliability that exceeds the other competitors ??? We did not think so. That is why our company is the best and fastest growing of it's kind and will soon compete with AT&T and MCI and all the big companies in providing Internet Service.

For complete information please mailto:ASE1000@1stfamily.com and type "More Info" in the subject box.

You will receive our webpage address where you can get enrolled in seconds !!

We offer very competitive low international calling rates worldwide, with saving up to 85% !!!

Some examples:

Australia - USA = 0.29 US$/minute
Hong Kong - UK = 0.61 US$/minute
New Zealand - Netherlands = 0.66 US$/minute
Japan - Germany = 0.61 US$/minute
Singapore - USA = 0.35 US$/minute
Sweden- Canada = 0.36 US$/minute
Germany- Dom Rep =0.71 US$/minute
France - Bahamas = 0.60 US$/minute

There are no fees, other than usage !!

If you might be interested in more information on our services and rates to other countries, please visit our website at http://www.angelfire.com/biz/GTconsult or send us a message to GTconsult@freemail.nl and tell us the countries you call now, what you are paying now and which service you use at the moment !!

If you think this is not the appropriate newsgroup to place this advert, please let us know by sending an e-mail to remove@freemail.nl and mention the newsgroup in the subject heading, so that in future we will not advertise in this newsgroup again !!

The default environment for programs called via shel_write() is not expandable, but the one used by Pexec() is, which is what putenv() would do (I don't know whether the Pure C- and/or the MiNT-Libs have this call). Pexec() uses the parent's environment as default, and this may be changed by altering p_env in the basepage. AFAIK, this is documented.

Of course, you also have to create a copy of the original environment and alter it afterwards for this to work, but a library call which does so automatically would be much more convenient.

Ciao

Thomas

Actually, it is in Geneva and MultiTOS. There is a new mode of
shel_write() (off the top of my head I think it's 9 or 10), which does
this.

>but the one used by Pexec() is, which is what putenv() would

Yes, a Pexec() with 0L as the basepage pointer parameter will cause the
parent's basepage to be used instead. So if you putenv() the vars to your

own basepage and then Pexec() a child, it works.

>Of course, you also have to create a copy of the original environment and

...at which point you might as well just pass the env to Pexec() instead
of using 0L...

> block allocated in desired space above then you would not be able to
> extend the block under TOS either.

However, if Mgrow() is intelligent and knows whether a block is allocated
just beyond the one that needs to be grown, then it could simply do
something like the following:

```
     if( !inuse( memory_just_beyond_this_block ) )  {
          zero( end_of_this_block + 1, newsize - currentsize );
          return success;
     }

     pointer = Malloc( newsize );
     if( !pointer )
          return failure_code;
     memmove( pointer, oldbuffer, size_of_oldbuffer );
     Mfree( oldbuffer );
     return pointer;
```

The second part (allocate new, copy, release old) is somewhat like what the C realloc() call does, if I am not mistaken.

Quote For The Month:

(From an infomercial currently playing on New Zealand Television)

"What do our customers tell us about using the Pure Water Distiller?"
"... [The Water] is so easy to drink, compared to other water"

Yeah, I agree. Whenever I want to drink normal water, I have to consult a _really_big_ instruction manual - and even then, it takes me half an hour before I can start to drink, because there aren't any pictures showing me how. But with the Pure Water Distiller, they include a simple one-page leaflet - WITH PICTURES!! - that show me how to drink water...

Why zero the memory? Malloc() and Mxalloc() don't do so, so why should an
Mgrow() do it?

> The second part (allocate new, copy, release old) is somewhat like what
> the C realloc() call does, if I am not mistaken.
The whole routine is more or less what realloc() does if the new block is
larger than the old one. But the name Mgrow() for me implies that the
address of the block is untouched, as it is with Mshrink().

Ciao

Well, OK, I forgot that. But honestly I don't think it's a good idea to
alter the AES' default environment from within an application - or would
this call just affect the AES environment of the calling app? I don't
have the docs here right now ...

>>Of course, you also have to create a copy of the original environment and

When you don't have putenv() or something similar, it's maybe better to
do so (however, the basepage method is still the better solution if you
are going to use some library call like system() or popen()).

Ciao

... which begs the question: Why didn't they call it Mrealloc?

Perhaps it creates a larger block, copies the old, and then reprograms the CPU's MMU (on '030s, full '040s or better) into thinking that the old block is still at the same place, just slightly bigger?

Quote For The Month:

(From an infomercial currently playing on New Zealand Television)

"What do our customers tell us about using the Pure Water Distiller?"
"... [The Water] is so easy to drink, compared to other water"

Yeah, I agree. Whenever I want to drink normal water, I have to consult a _really_big_ instruction manual - and even then, it takes me half an hour before I can start to drink, because there aren't any pictures showing me how. But with the Pure Water Distiller, they include a simple one-page leaflet - WITH PICTURES!! - that show me how to drink water...

Why? You can always do that yourself. This is nothing you need a kernel for.

No, it modifies the env for the entire AES. I agree that if all you want to do is execute a child with a particular set of vars, it's a very bad idea to be changing the AES's env. You should be using the extended modes of shel_write() instead.

Agreed.

However, one could also argue that "allocating a memory block and readying
it for use" could be considered a kernels job.

Which unfortunately have the same inconveniences as Pexec(), if you just
want to /add/ new vars to the existing environment ...

Are you sure you /removed/ some? The gap was even larger in this posting
... Maybe you use tabs instead of spaces? Or do you just want to "tease"
people here? ;)

Ciao

Thomas

After allocation a memory block is already ready for use. In most cases,
you allocate a block to fill it with data afterwards, and (at least I)
almost never need it zeroed before filling in data.

Ciao

Thomas

P.S.: Your "Quote For The Month" may be funny, but a) it's far too long
      for a .signature and b) gets annoying if found in each posting. So,
      could you please reduce the length and the frequency of posting?
      Thanks.

Hiya;

I am working on an assembly language program and have a problem. My program needs to execute a routine precisely every 1/120 second. The actual routine is a doddle, plenty of time to sit and wait between executions, but I have no idea how to achieve precise timing.

Any suggestions?

thanks

$50,000.00 for only $5.00 within 2 MONTHS?????
==========

You gotta be crazy! How on earth do you think you can buy 50 grand for lousy 5 bucks? Well, that's what I was wondering, too until I came across this letter.

First of all, IT'S PERFECTLY LEGAL! (Call 1-800-725-2161) if you have any questions about the following opportunity to make $50,000.00 and that probably WITHIN LESS THAN TWO MONTHS!

Well, here it goes:
A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So I thought, "Yeah, right, this must be a joke," but like most of us I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names and address stated in the article. You then place your own name and address in the bottom of the list at #5, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it.

I knew that that was the opportunity I had waited for for a long time. I thought it was about time that the money of the world gets into the right hands! OURS, right? I never had a doubt that this thing will actually work and even if it didn't, what were 5 stamps and $5.00 for a try?

As I mentioned before, like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal!

Now, that's how your story WILL sound like, too if you participate:

Well GUESS WHAT!!... with in 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just kept coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had made a total of over $1,000.00!!!!!! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in .....

Let me tell you how this works and most importantly, Why

it works....also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

#1 Robert Jezil
114 Jefferson Ave.
Slidell, LA 70460

#2 Phil Walther Jr.
9495 Annapolis Lane North
Maple Grove, MN 55369

#3 C. E. Burkman
170 University Ave. W
Suite 12-129
Waterloo, Ontario
N2L 3E9

#4 A. Bailey
1207 Reeves Road
Plainfield, IN 46168

#5 J. Martin
P.O. Box 2292
Reston, Va. 20190

STEP 2: Now take the #1 name off the list that you see above, move the other names up (2 becomes 1, 3 becomes 2, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following:

FOR NETSCAPE USERS:

1) Click on any newsgroup, like normal. Then click on "To News", which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (remember to add your name to number 5 and move the rest up)

4) When your done typing in the WHOLE letter, click on 'FILE' above the send button. Then, 'SAVE AS..' DO NOT SEND YOUR ARTICLE UNTILL YOU SAVE IT. (so you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your first copy! (click the 'SEND' button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'. Click on attach file then find your letter wherever you saved it. Click once on your file then click 'OPEN' then click 'OK'. If you did this right , you should see your filename in the 'ATTACHMENT BOX' and it will be shaded.

NOW POST AWAY!

FOR INTERNET EXPLORER:
It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

Go to the newsgroups and press 'POST AN ARTICLE' type in your flashy subject and click the large window below. Press 'CTRL' and 'V' and the article will appear in the message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.** Now re-highlight the article and re-copy it so you have the changes.... then all you have to do for each newsgroup is 'CTRL' and 'V' and press 'POST'. It's that easy!! THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for noncommercial use. To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you con invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now the WHY part:

This entire principle works because it is in a format of an upside down tree with thousands of branches. Everyone below you will see to it that the tree continues because they want to get money. Those below THEM will continue because THEY want to get the cash etc.

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM of 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00
at #4 $225.00
at #3 $3,375.00
at #2 $50,625.00
at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 and start posting again.
The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! And this will go on and on and on and on.... get the picture? Well, there's 5,000,000,000 people on the world and most of them will eventually end up being hooked into the internet. So there are virtually unlimited resources. Of course this will work the best at the very beginning so the faster you post, the better for YOU!

So can you afford $5.00 and see if it really works?? I think so! People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening

when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income. Thanks once again...

> executions, but I have no idea how to achieve precise timing.

Program one of the timers inside the MFP (there is one unused) to expire
120 times a second, and set it up the cause a 68000 exception (interupt).

There is no guarantee though that the handler is called *each* time at the
right time, as there might be a higher priority interupt in service at the
time, but that should happen rarely.

Cheers Peter

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur
stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession,
are in desperate need of fresh material, and are more than willing to review photos
submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative themes.
At Photo Phoenix International, we delight in and value the work of people who view
photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE,
ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY,
ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY,
HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES,
RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes,
your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence,
the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send
entire portfolio unless we ask for it.

One-Number service puts you in control of your calls while ensuring that your calls,
messages and faxes reach you regardless of your location. One-Number service
does this by linking your existing telephones, cell phones, pagers, and fax machines
through a single telephone number.

YOUR One-Number ACCOUNT COMES STANDARD WITH THESE
FEATURES
- Consolidates your phone, fax, voice-mail and paging services
- Works with your existing products and services, no need to change
- Easily lets you designate yourself as available or unavailable
- Rings you at up to three numbers simultaneously
- Never-busy number accepts multiple incoming calls and faxes
- Call Screening (by name) lets you know who is calling
- Call Waiting lets you know somebody else is calling
- Call Move lets you easily transfer calls among different phones
- Call Conferencing allows conferences with other parties
- Fax Notification on your pager for incoming fax messages
- Redirect calls to Personal Operator (live person) if desired
- AND MUCH MORE

Virtual Office Communications Company is not a phone company, a long distance carrier,
nor do we sell telephone equipment, cellular phones, cellular service, pager or pager service.
Instead, we offer service to integrate your existing products, adding value to what you already
have by letting your phones, pagers, fax machines and voice-mail systems work together
seamlessly.

To learn more please visit our web site at: http://www.mynumber.com

Please do not reply by e-mail as we are not set up to respond to e-mail requests.

ari.talk,z-netzrechner.atari.allgemein

hello experts,

i'm planing to to connect an atari tt8 to an existing nt/w95 -
ethernet netwok - here my questions :

1. what harware do i need for the tt8 (networking card ?) and where
can i get such a thing .

2. what software do i need to use at least the harddisks, cd-roms,
worms, printers, modems and isdn-cards on the pc based part of the
network - via tcp/ip.

3. as i use a swichboard to use just 1 keyboard,1 mouse and 1monitor
on up to 6 different pc's at the sysops room - can there be a solution
for the tt either - means using a com port mouse and a standard pc
keyboard on the tt - monitor should work as far as i remember my atary
days ...

I've just taken the possibly foolish option and upgraded my Falcon from MagiC5.03 to 5.11!

Of course, in true MagiC tradition, there are *no* upgrade instructions and *no* docs at all about what the differences between these two versions are!!

Why do these arrogant programmers feel there is no need to document version changes. What bloody planet are they on????

System Solutions seem to be plugging the fact it's MagiC 5.1 (but as they've already screwed up my upgrade, I suspect they will be of no use in telling me what the differences are). They could almost be Microsoft Dealers for the amount of knowledge they seem to posses about what they sell!!!!!!!

Can anyone in these groups:

a) List the differences between 5.03 and 5.11?
b) Tell me where I can find programmer docs for 5.11?
c) Tell me how to turn *off* the 'realtime' windows. Lovely at first, but now becoming annoying!!

Gary

I think there is a CPX that let you turn on/off the realtime windows.
Should be on the upgrade disk!

Well... it's a bit long to explain it, not because it's hard to
understand, but if you don't know exactly what is the MFP and if you
don't have documentation on it, I suppose that you're NOT a fanatic of
interrupt. The problem is that putting on an interrupt is an easy thing
for a demo (I dont' save anything and if it crash at the end, it doesn't
matter) but in a "clean" way, argll!!! It's not so easy. Same for
cleaning interrupt correctly at the end (espacially in a multitasking
context). And debugging something in interrupt is hard.
So, two possibilities:
1) You explain us exactly what you want to do, and we all try to find
the easiest way for doing that, perhaps without interrupt.
2) I "zip" you some pieces of code, 5 Kg of coffee and 2 kg of aspirine,
and you try. 8-))

Newsgroups: comp.sys.atari.programmer

Hi guys,

I'm trying to code up some completely generic resource slider routines, and I need some help. Apologies if my description is not terribly good, as this is quite a complex problem that has stumped me for a while.

There are two fundamental approaches to implementing this. The first is to follow (as much as possible) the descriptions of the slider routines in ProGem. To avoid roundoff problems the ProGem routines describe using a range of 1-1000 for the travel of the slider, which is used for the wind_set call, which sets the pixel size of the (window) slider internally. As I can't use the wind_set call for a slider within a resource, how do I convert that 1-1000 range into the absolute pixel value? (This sounds easy but it's more involved when the slider size, slidebar size and the various document units are all completely variable)

If for these sliders you don't use a large range and instead base everything on pixel values, I get problems with roundoff errors. Basically my slider routines work for dragging the slider, the size is worked out using the proportion of the total document to the visible document. The problem is positioning the slider by lines - depending on the interaction between the document sizes, slidebar and slider sizes, one line is not necessarily an equal number of pixel steps. So when I move the slider down one line (by clicking on the down arrow, say) I need to know whether to position the slider by (say) 7 or 8 pixels to position it correctly. Take a look at how Selectric's slider works to understand what I mean. I've tried to decode E_Gem's slider routines but not being a C programmer it's pretty confusing.

I hope I'm getting across what I need to get across!

Thanks in advance... (BTW I'm using GFA if it makes any difference)

It's called SET_FLG.CPX and its location on the installation diskette is A:\MAGX_2\CPX\SET_FLG.CPX.

Check your CPX folder, maybe you just haven't activated it?

Oh sorry! 8-)

In v5.1 you can have the windows to update in realtime when using the horisontal and vertical sliders. However, I must say I prefer the "ghostbox".

Take care,
Daniel

Well, even 5.0x had realtime /sliders/, IIRC. What 5.1 adds is realtime
sizing and moving of windows, just as it is with using WINX and SingleTOS.

Ciao

Thomas

> and you try. 8-))

You're right, in all these years I've never needed to use interrupts before, mostly I wrote simple little utils (the most complex thing I ever did in assembly on an ST was a prg to convert "PCB DESIGNER" board layouts to IMG bitmaps, which certainly didn't require interrupts). I have some docs on the MFP registers, etc, but nothing that actually shows how to go about dealing with it.
The program I'm working on is strictly for my own use. I have a home recording setup, and both my MIDI sequencer and my hard disk recorder sync to MIDI Time Code (MTC), but neither will generate it, so the only way I can sync the two together right now is to run an analog tape with SMPTE time code on it and sync to that (which wears out the tape and the deck, and wastes time waiting for rewind). Since I have a few "spare" STs sitting around, I figured I'd set one up to generate MTC. For the flavor of MTC I want, I need to spit out code every 1/120 second.
The machine certainly wouldn't be multitasking. All it'll be doing while generating the MTC is checking for keypress or maybe mouse click (strictly in a start/stop capacity) and waiting for the interrupt.

Any help you can offer is appreciated.

No prob, you prefer ghostbox, just press CTRL key while moving.
If you want to have ghostbox as default, and CTRL key for realtime, go
in the INF and put flg=6.

>
> Any suggestions?

OK, there are a few ways you could go about this but I think the best method
is to use the ST MFP Timer A. On the STE this is normally used to count
frames from the sound DMA chip, however it can be reprogrammed, you should be

aware that any software that makes use of the sound DMA may not work properly
with this routine installed.

```
TACR    equ     $fffa19
TADR    equ     $fffa1f

    move.b      #$7,TACR        ; select 12,288hz
    move.b      #$67,TADR       ; set 103 decrements between ints.
```

This will cause an interrupt 119.3 times per second which is just about as
close you can get to 120. Now you have another choice to make, do you want to
detect the interrupt through the 68k level 6 autovector or more simply just
use the MFP hardware bound interrupts. For simplicity I'll go with the
latter. So here is a complete routine to install your interrupt:

```
install:
    bclr        #5,$fffa07          ; disable Timer A interrupt
    move.l      #myrout,$134        ; store your routine
    move.b      #$6,TACR            ; select 12,288hz
    move.b      #$67,TADR           ; set 103 decs. between ints.
    bset        #5,$fffa07          ; enable Timer A interrupt
    rts
```

Your routine should end with 'RTS' and not 'RTE' as you might expect.

Hope this is helpful, Jr.

>slider within a resource, how do I convert that 1-1000 range into the
>absolute pixel value?

Er, don't - until absolutely necessary. Keep track of things as
percentages of the whole.

>(This sounds easy but it's more involved when the slider size,
>slidebar size and the various document units are all completely
>variable)

Things are simpler if you take an abstract approach. Think of a
"document" as consisting of so many "units" (unit_off below) and the
"window" as being able to display a certain amount of those units at
any one time (unit_vis below). The portion of the "document" being
displayed can also be denoted as a 'unit offset' from zero (unit_off
below).

```
 slider_position = (1000 * unit_off) / (unit_tot - unit_vis)

 slider_size =  (1000 * unit_vis) / unit_tot
 if slider_size > 1000 then slider_size = 1000 /* for window > document */
```

To figure out which bit should be displayed from the slider ...

```
 unit_off = ((slider_position + 1) * (unit_tot - unit_vis)) / 1000;
```

... note that 32 bit math is needed to maintain precision.

>If for these sliders you don't use a large range and instead base
>everything on pixel values, I get problems with roundoff errors.
>Basically my slider routines work for dragging the slider, the size is
>worked out using the proportion of the total document to the visible
>document. The problem is positioning the slider by lines - depending
>on the interaction between the document sizes, slidebar and slider
>sizes, one line is not necessarily an equal number of pixel steps. So

>when I move the slider down one line (by clicking on the down arrow,
>say) I need to know whether to position the slider by (say) 7 or 8
>pixels to position it correctly. Take a look at how Selectric's slider
>works to understand what I mean. I've tried to decode E_Gem's slider
>routines but not being a C programmer it's pretty confusing.

Well, stuffing some values into the above formulas. Let's say we have
a 250 line document, our "window" displays 12 lines and the top line
in the window is line 57 (there is a line 0).

```
 slider_position = (1000 * 57) / (250 - 12) = 237
 slider_size     = (1000 * 12) / 250        =  48
```

This translates into 237 tenths of a percentage and 48 tenths of a
percent, so the slider size is 4.8% of its maximum size and is
positioned 23.7% of the way along.

For arguments sake, lets assume you constructed your resource where
the slider has a GBOX under it (ie parent of the slider) which is
exactly the full size the slider can be. Let's also assume this is a
vertical slider ...

When you want to adjust the slider, set ob_height[SLIDER] to 4.8% of
ob_height[GBOX], and set ob_y[SLIDER] to 23.7% of ob_height[GBOX] then
objc_draw the GBOX. It's best to check that the new and current
heights are different before objc_draw to save unnecessary drawing.

Another improvement would be to only use objc_draw if the mouse
happens to be over the slider, else use the VDI so the mouse stays on.

>I hope I'm getting across what I need to get across!

So do I else I've answered the wrong thing! <G>

Here's a bit of code which also shows one or two things I've not
mentioned. Sorry, its in C ...

Is there a way to alter the memory protection status of a block of allocated memory?

For example:

```
pointer = Mxalloc( size, TT|PRIVATE );
...
(Do something with memory block)
...
Mtype( pointer, SHARED );
```

where the "Mtype" function alters protection from PRIVATE to SHARED

Quote For The Month:

(From an infomercial currently playing on New Zealand Television)

"What do our customers tell us about using the Pure Water Distiller?"
"... [The Water] is so easy to drink, compared to other water"

Yeah, I agree. Whenever I want to drink normal water, I have to consult a _really_big_ instruction manual - and even then, it takes me half an hour before I can start to drink, because there aren't any pictures showing me how. But with the Pure Water Distiller, they include a simple one-page leaflet - WITH PICTURES!! - that show me how to drink water...

Your best bet would be to use Timer A if it's available which can be
set up to count clock cycles for you. If you want further information,
then mail me and I will sig out some of my old source codes and docs.

Mark.

Okay. Just checked it. Nope. I have no cpx by that name. in the folder above
I have just magxconf.cpx and tslice.cpx! That's all :(

Maybe us English user's don't get it :(

Oh yes. I just tried that. I also found that double clicking on a window's
menu bar, hides the body of the window and just leaves the bar. This is
really, really nice!! :) Double clicking again, brings it back. Cool :)

I just think it's a shame there's no documentation on these new features :(

Gary

IMHO there should be a complete slider object available, but since there
isn't, it is necessary to to it by hand.

: Thanks in advance... (BTW I'm using GFA if it makes any difference)

Well I can't help with GFA (Basic?) but I can help with the sliders in
general.

The problems you are having seem to be mostly related to converting the
logical 1-1000 scale to the pixel positions onscreen. You can do this
with this simple formula. It will convert between any two scales:

source_value * dest_range / source_range

So to convert your 1-1000 scale to the pixel scale of the slider (assuming

the slider is 100 pixels high) you could use:

pixel_position = logical_position * 100 / 1000

To convert a pixel value back to a logical value (useful when the user drags the slider to a new position) you would use:

logical_position = pixel_position * 1000 / 100

Note that the 100 would be better replaced with a way of determining the slider height, such as tree[object].ob_height. This way adjusting the slider size in the resource would not require a change to the program.

Note that you could also convert directly between document size and slider size in the same way:

pixel_position = position_in_document * slider_size / document_size

and

position_in_document = pixel_position * document_size / slider_size

In any case, with that you should be able to do all the conversions you need. You probably want some functions for manipulating the slider, such as:

set_slider_position(position , range)
this will allow you to do things like:
set_slider_position(current_position_in_document , document_size)

get_slider_position(range)
this will enable things like:
position_in_document = get_slider_position(document_size)

You will want similar functions for setting the size of the slider.

In most cases, you will also find it necessary to copy areas of the display that are still visible during scrolling, rather than redrawing them. For example, if the user scrolls down one line, only the one new line should be drawn, the rest should be copied up on the screen by the size of one line. Remember that it is not as simple as copying the whole document display area, though - the rectangle list must be observed at all times.

I hope this has been of some help. If I can be of further assistance, don't hesitate to ask.

Am I right in thinking this is for showing a text document.. does the formula offered take into account a document with less lines than the scroller ie: scroller=100 pixels.. document=70 lines, but a slidebar is still needed because the document is longer than a visible page?

I have a slider in STOS BASIC that I use for displaying documents in diskzine shells, check out any edition of ST+ Diskmag and you can see it.. works for all size documents small or large.. it is a progresion bar.. but easily changed to slider as can be imagined:)

Cheers !ynoT (ATARI Programmer)

Thanks for the code. I'll look into it in a few days when I have the time.

But - is 119.3 really as close as you can get? For this project I really need to get well within the 119.9-120.1 range. I'm beginning to think I'll have to tack an oscillator on the cart port.

thanks again

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people

on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to work. This
system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 =

*** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = *** $39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this as a business. If you treat it like a hobby that is how it will treat you. You could even organize small meetings with your people and their prospects and work with your leaders. Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help you in your financial need, you may pay me back if and when you can" to the following needy people:

You can get exactly 120Hz (untested (*)) with a divider of 64 and a initial TADR
value of 160 for example (2457600/64 = 38400, 38400/160 = 240), and using
your own counter in the interrupt routine to trigger your event every
2nd interrupt. Give it a try, the values above should be 5 for TACR and
160 for TADR.
If you need extremely precise timings, you could busy-wait, of course...
Just wait for the appropriate number of cycles until the next event while

the interrupts are turned off.

Dear friends,

I am buying software from all over the world to sell to german
firms. In case you have something to sell, please do send a
SHORT email, describing briefly what the main features are.
Please tell an address for easy downloading of demos.

Thank you, Software-it Germany

> this with this simple formula. It will convert between any two scales:

So the way to do this properly is definitely to stick to the logical scale. Cool, that's one question answered...

So, do you maintain the slider_size and slider_position variables in logical units, and then only do the pixel conversions when the time comes to actually change the slider?

> So to convert your 1-1000 scale to the pixel scale of the slider
> (assuming the slider is 100 pixels high) you could use:
>
> pixel_position = logical_position * 100 / 1000

That "100" that you refer to - is that the size of the slider itself, the size of the slidebar, or the range of freedom of movement that the slider has on the slidebar? (ie the slidebar size minus the slider size)

> Note that the 100 would be better replaced with a way of determining
> the slider height, such as tree[object].ob_height. This way adjusting

Yes, I do this already.

> pixel_position = position_in_document * slider_size / document_size

"position_in_document" I guess is the line number, slider_size (in logical units?). What units is "document_size" in? If the document is (say) 7 lines, does document_size = 7?

I must say I didn't have much luck in getting this formula to work - however, I did get ProGem's formula (below) to work, but that does not include the slider size in the formula, which is not ideal, obviously.

```
 pixel_position = 1000 * (top_wind - top_doc) / (total_doc - seen_doc)
```

> set_slider_position(position , range)
>
> You will want similar functions for setting the size of the slider.

Yes, I do all this. So far, this is the neatest code I've _ever_ written, as it's going to become part of my personal GEM library that I'm building up.

> In most cases, you will also find it necessary to copy areas of the
> display that are still visible during scrolling, rather than redrawing
> them.

Ah, that's good advice - I don't do that currently because most of the redraw area is pretty small - 4 or 5 lines or so. But I will certainly add that to the routines (when I get them working... :)

> I hope this has been of some help. If I can be of further assistance,
> don't hesitate to ask.

Thanks Mario, you've been a great help. Let me have a play and I'll know whether I need to bother you again :)

Much appreciated...

I am looking for the game called Phoenix, I know it was released for
the 2600. That version is not the one I am needing. I am looking for
a release on either the 800/XL, 5200, 7800, or the ST computer. I
remember back in 84-85 reading a review for it, I do not remember what
system it was released for. I REALLY need this game, if someone can
help me out, I will pay $$$ for it. Please let me know by e-mail.
Thank you in advance.

Sincerely,

Steve Flater

(My news server doesn't seem to have received earlier articles in this
thread. From memory you use STOS, which I am not familiar with)

A pseudocode algorithm you could use (Typed entirely from memory) is:

(Ignoring error checking)

```
set_scroller_size:
  get window work area
  num_lines_displayable = work_area_height / height_of_one_line
  num_chars_displayable = work_area_width / width_of_one_char
  if num_lines_displayable is less than lines_in_document
    display vertical scroll thumb full size
  else
    new_size = num_lines_displayable / lines_in_document
```

```
    new_position = top_line / (lines_in_document - num_lines_displayable)
    display vertical scroll thumb at new_position with new_size
  end if
  if num_chars_displayable is less than longest_line
    display horizontal scroll thumb full size
  else
    new_size = num_chars_displayable / longest_line
    new_position = offset_in_line / (longest_line - num_chars_displayable)
    display horizontal scroll thumb at new_position with new_size
  end if
```

(I've ignored clipping and error checks in the following display pseudocode)

```
display_horizontal_scroller:
  get horizontal scroll bar position
  if scroller is full size
    left = 0
    right = width_of_scroll_area
  else
    scroll_width_in_pixels = new_size_percentage * width_of_scroll_area
    range = width_of_scroll_area - scroll_width_in_pixels
    left = new_position_percentage * range
    right = left + range
  end if
  top = 0
  bottom = height_of_horizontal_scroll_bar
  add scrollbar position to (left,top) and (right,bottom)
  draw thumb from (left,top) to (right,bottom)

display_vertical_scroller:
  get vertical scroll bar position
  if scroller is full size
    top = 0
    bottom = height_of_scroll_area
  else
    scroll_height_in_pixels = new_size_percentage * height_of_scroll_area
    range = height_of_scroll_area - scroll_height_in_pixels
    top = new_position_percentage * range
    bottom = top + range
  end if
  left = 0
  right = width_of_vertical_scroll_bar
  add scrollbar position to (left,top) and (right,bottom)
  draw thumb from (left,top) to (right,bottom)
```

(There is probably something obvious I've left out)

Quote For The Month:

(From an infomercial currently playing on New Zealand Television)

"What do our customers tell us about using the Pure Water Distiller?"
"... [The Water] is so easy to drink, compared to other water"

Yeah, I agree. Whenever I want to drink normal water, I have to consult a _really_big_ instruction manual - and even then, it takes me half an hour before I can start to drink, because there aren't any pictures showing me how. But with the Pure Water Distiller, they include a simple one-page leaflet - WITH PICTURES!! - that show me how to drink water...

If you plan to keep them in RAM until the program is done, there will be no (or very little) fragmentation. Fragmentation occurs when the blocks released are isolated and too small to be reused.

Pagestream uses Pexec() to load its modules (import/export and printer drivers).

ONLY AVAILABLE IN THE:
U.S.A, CANADA VIRGIN ISLANDS, AND PUERTO RICO

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax, pager, voice-mail, and cellular numbers and give them your New "Virtual Office" 800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone? Wouldn't it be nice to be able to give everyone just ONE phone number that will find you anywhere you are? Even out of town, or in a restaurant, or even on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!, Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888

Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web sight:
http://www.mynumber.com

* Based on our best priced plan.

If your program is intended to run on TOS only

you will run into problems if using Malloc() systemcalls.
There is a limit of ~10 Malloc() calls, after this the system
will crasch or be confused
and if writing to HD crasching the filesystem.

If using MiNT you can start child processes as modules.
Then communicate with the modules by using pipes or GEM messages.
In this way your modules will run whithout pausing your application.

GEMDOS has a lot of bugs and limitations, but it's not /that/ bad. You can
safely call Malloc() more than ten times. IIRC, it gets dangerous after
30 calls or so.

If using a C-library, using malloc() is a better idea, as it Mallocs()
larger chunks of memory and then handles them internally.

> If using MiNT you can start child processes as modules.

> In this way your modules will run whithout pausing your application.
IPC with AES messages without a multitasking AES is only possible between the main application and accessories, but not between two processes. A much better approach for IPC with MiNT (and, with some restrictions, with MagiC 5 as well) are pipes (which have already been mentioned), shared memory and signals.

Ciao

Thomas

You mean 'malloc()' I hope? Don't use 'Malloc()'. Using 'malloc()' is OK, however the quality of that call depends on the quality of your compiler's library.

Definitely, use one specific 'malloc()' call for each module you want to load.

Regards.

Going through the Magic 5 Docs I came across a call called Mgrow.
The line in the docs is

#define Mgrow(a,b)   Mshrink(a,b)

I presume this is for enlarging an area of reserved memory.
Is this call only available under MagiC or does TOS support?

If TOS does not support this call is there anyway to enlarge a block
of memory that has already been allocated?

David

Naaah, don't do this, go the generic way, and it'll work with all resolutions, graphics cards and other hardware. This is convert the file to VDI standard format, then use vr_trnfm() and vro_cpyfm().

It's quite ok to do a Malloc() each time you load a module, since the
number of modules will be low, I guess. You run into trouble only (on
old TOS versions) when you do dozens and hundreds of Malloc().

Cheers Peter

Actually I'm using assembler so my compilers library has nothing to do
with it.
Acording to the Devpac3 manual the call is m_alloc (GEMDOS $48)

Thanks for the help from everyone who has answered, even if they all
assume I'm programming in C :-)

> Can ANYONE help me!?

Hi,

This is what I use for starting DSP binaries. It's taken from a devpac
macro file, but I guess you can see what's what. The ability code is just
taken, since the xbios trap for getting this returns this value if no
other program is using the DSP. It doesn't really matter if you only use
one program in the DSP.

```
Dsp_ExecProg    #bincode,#(eobincode-bincode)/3,#$8001
```

Loading .lods is done with Dsp_LoadProg, but I've never used that myself.

Hope it helps,

Tomas

1) Lock the screen & mouse with wind_update()
2) use vq_mouse(handle,&mb,&mx,&my) to get the locations
3) only call v_hide_c()/v_show_c() if you have to update the rectangle

under the mouse.

It will work, honest.....

Craig.

To avoid memory fragmentation, the best is to use a Memory-Manager.
Wehave made a package called M&E with module to load picture, save
picture, do FXon pictures; The package also conatin a dithering module
and a Memory-Manager. You have to load it (it's an external file) and
just use it. Actually three memory-Manager which respect our concept are
available. The first just do a big Malloc() then move the block inside,
in order to avoid completly memory fragmentation. The second one use
malloc() re-alloc() and the third one use swap disk thecnik for virtaul
memory. For your programmer point of vue they are exactly the same so
the user can use the MEM he wants to, and your software will conitnue
ruuning as before.
Take a look at our web site, the licence for M&E is free.

Unfortunatly that's not enought for two reasons:
1) Transform-form don't work in TC mode. So if you try to do a Transform form on a TC file on an ET 4000 GFX Card you get very bad things on the screen.
2) The data format is not the inly problem: the palette order is not the same on a GFX Card that on an ATARI machine.

For these two reasons, our TRM/Dithering module change the palette order according to the card you are running on. For the data format, if you

give the TRM an ATARI picture and want to diplay it on a NOVA card, if its a plane based picture, the TRM will give it to you in VDI Format and after you 'll have to use Transfomr-Form but if it's a TC picture, the TRM do the Transform_Form itself, according the the bit order of the card.

TOS (GEMDOS) does not support enlarging a memory block.

Allocate a new block of the desired size, copy the old contents and free the old block. This is called realloc() in C.

This is absolutely correct.

I have never read any Magic doc, but redefining as 'Mgrow()' a system call
which actually shrinks an allocated block sounds weird to me...

> under the mouse.
>
> It will work, honest.....
It's not a good idea to use the v_xxx-calls for the mouse, especially
v_hide_c() and v_show_c(). AES and VDI keep separate countes for
graf_mouse() and v_xxxx_c(), so it may lead to strange effects (mouse
pointer disappearing) if a program that used v_hide_c() either crashes or
forgets to unhide the pointer on exit.

There are two AES-calls to determine the current pointer coordinates and
one to hide/show the mouse, and I don't see any reason not to use them.
It's even better to use mouse rectangle events which actually wait for a
movement instead of a busy-waiting loop with vq_mouse().

Ciao

Thomas

Hi,
I have a lot of measurement data files that were produced under GFA-Basic 2.0. The files contain a binary array of float variables (6 bytes). As I do not longer have an Atari at hand, I would like to convert these files to be input into Windows Programs (sorry).

Can anybody help with information on the bit-wise encoding of the 6 byte IEEE float format used in GFA-Basic or does somebody have a C routine that performs the conversion to 4byte float or 8byte double?

thanks
Stefan

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax, pager, voice-mail, and cellular numbers and give them your New "Virtual Office" 800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone? Wouldn't it be nice to be able to give everyone just ONE phone number that will find you anywhere you are? Even out of town, or in a restaurant, or even on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!, Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888 Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection, Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web sight:
http://www.mynumber.com

* Based on our best priced plan.

Oops. I believe that I've made a booboo. I was thumbing through an old issue of a programmers mag (DDJ) and I mistakenly linked RTI to Untel, whereas the x86 instruction is actually "IRET"

Correct but not viable for me as there may not be enough memory to hold both
the new block and the original block in memory at the same time as I'm
dealing with sound samples which can be extremely large.

They don't call it the "40-folder bug" for nothing. You'd think the
TOS programmers were Arabic or something. ("40" == "Infinity" in
mid-east traditions... thus - "Ali-Baba & the 40 thieves", the
Great Flood lasting 40 days & 40 nights, etc...)

Making your programs difficult to use (requiring users to memorize
command line parameters) is a bad programming practice, period.

You've got a GUI on ROM, for goodness sakes! Learn how to use it!

m > There is no problem with getting "long" filenames on the
m > commandline, just the same as there is no problem with short
m > filenames, middle sized filenames or anything else.

There is a 128 byte limit on the command line in the program header,
so if you have a REALLY long filename, or more than one filename...

Digital Data Promotions Online is pleased to present a new yellow pages style
listing of businesses on CD-ROM. This listing will include links to your
businesses web site, text, graphics, picture, as well as audio and video clips; to
bring your business into the world of multimedia advertising. In addition, any
ads promoted on the CD will also be listed on our web site, in the same cataloged
method, and updates to your information will be possible. We are currently
promoting this CD across the US and the world, and space is filling up quickly.
For further information you can visit our web site at

http://www.intergate.bc.ca/business/ddpo

Or download a quick demo of the program, and pricing list, with attached order
form at

http://www.intergate.bc.ca/business/advert.exe

We hope to see you online soon.

Thank you for your interest.

Any questions or comments can be directed to

grin But what do you want to say? The 40-folder-problem has been fixed
in TOS 1.04 (i.e. the info about folders which are no longer in use get
cleared), so it's very unlikely to overflow the GEMDOS-pool with folders.
You can do so by calling Malloc() too often (or by playing around with
output redirection, which has never fully worked in plain TOS), but you
can call Malloc() more than 10 times (which was denied in the posting I
have replied to).

>>IPC with AES messages without a multitasking AES is only possible between

But pipes, shared memory and signals have the advantage that they work
without a multitasking AES and can be used by non-GEM-applications as
well. What's really missing is an Fselect()-mode for evnt_multi() ...

Ciao

Thomas

If you need the samples to be in one contigous block of memory, than
there's no better way. If it's possible to use a linked list of smaller
blocks for your purpose, this would be a solution. I had the same problem
when I wrote the Ramdisk-XFS for MagiC, and after switching to a linked
list of 1K blocks, the problem was gone. The only problem with this
approach is that writing to the ramdisk is quite slow (compared to
reading and to writing to a "conventional" ramdisk) because of the many
Mxalloc()s ...

Ciao

Not allowing people to pass filenames to a program when they run it is
even worse. Period. And no one was talking about a command-line-driven
user interface, anyway.

> You've got a GUI on ROM, for goodness sakes! Learn how to use it!
So, if you want to edit three files at the same time, you prefer to run
the editor, use "File: open" three times instead of just dragging the
three files onto the editor's icon in the desktop? Even if so, I don't think
this is what mose people expect from a good GUI.

> There is a 128 byte limit on the command line in the program header,
> so if you have a REALLY long filename, or more than one filename...
Never heard of the ARGV-parameter-passing-scheme? It was created by Atari
many years ago, to allow commandlines of unlimited length (and to have
argv[0]). And the limit you mean is not in the program header, but in the
basepage.

Ciao

I might as well say this here and now:

There will be a JVM with JIT for Fenix. I'm currently working with a group of Amiga programmers porting Sun's JVM to Amiga (and Atari).

We are using Sun's JVM sources but are rewriting a lot of the interpreter
and are adding a JIT. My responsibilities in this project are the JIT, rewriting of the interpreter and the porting to Fenix.

Fenix's kernel has been designed with Java (and Limbo) in mind and there

is a OO dynamic linking scheme being designed so that native code can be used simply in "Java" programs. This makes it possible to use Java as a simple glue and script language for GUIs and other non performance critical applications.

We have worked from time to time for over a year on this project and have had working Amiga prototype versions for nearly a year. The JVM is capable of running javac compiling javac ie itself.

I cannot say who the Amiga programmers are and why we are doing this at the
moment but it will be clear in a couple of months.

I might as well say this here and now:

There will be a JVM with JIT for Fenix. I'm currently working with a
group of Amiga programmers porting Sun's JVM to Amiga (and Atari).

We are using Sun's JVM sources but are rewriting a lot of the
interpreter
and are adding a JIT. My responsibilities in this project are the JIT,
rewriting of the interpreter and the porting to Fenix.

Fenix's kernel has been designed with Java (and Limbo) in mind and there

is a OO dynamic linking scheme being designed so that native code can
be used simply in "Java" programs. This makes it possible to use Java
as a simple glue and script language for GUIs and other non performance
critical applications.

We have worked from time to time for over a year on this project and
have had working Amiga prototype versions for nearly a year. The JVM is
capable of running javac compiling javac ie itself.

I cannot say who the Amiga programmers are and why we are doing this at
the
moment but it will be clear in a couple of months.

I believe you mean "basepage" rather than "header".

And I believe that the limit is 126 bytes, not 128. AFAIK, the command
line that appears in the basepage is a C-ised Pascal string (ie zero/null
terminated and length-prefixed).

The basepage has 128 bytes of space of which the first byte is the length
of the command line, then the command line, and a zero byte at the end of
it.

(I also seem to recall something about a double null-byte, which would
reduce the command line length from 126 to 125)

People have written be being somewhat confused and asked be about the phoenix
project. I will say this once and for all:

Fenix is not phoenix and it has nothing to do with it. Fenix is a OS being written by
me while phoenix is a computer under development by centek in france. I have written
some letter to centek asking about the phoenix but have never got any reply so I don't
know anything about the phoenix apart from the information centek has released to the
public. Centek hasn't updated their pages for a long time now which honestly makes me
wonder what thay are doing. I have also spoken to some french programmers connected
to Centek. They didn't say anything about the phoenix and wouldn't answer my questions.

I admit that Fenix might be a bad name for the OS but I chose the name long before I even
heard about the phoenix. (Fenix was previously called first Galaxy and then Garden).

If anyone has a better name for Fenix you can email me and I will consider it!

As far as I remember, Pure C also has putenv() or setenv(). Look what functions containing "env" you can find in stdlib.h of Pure C's include directory, this may help. (Sorry I can't tell you more right now, but I don't have my Atari here ...)

I was (specifically, TTP programs). OTOH, allowing the desktop to pass 1 filename via the command line is part of the GUI, and SHOULD be implemented.

g > Never heard of the ARGV-parameter-passing-scheme?

I mentioned passing arguments using environment variables.

g > And the limit you mean is not in the program header, but in
g > the basepage.

Sorry, couldn't remember the right word at the time.

In any case, the issue turned out not to be the 128 byte limit, but rather replacing Fsfirst() with Readdir() and Fxattr(). (Help with MiNT filenames)

It's ICTARI time again !

Get thee to:

http://www.elis.demon.co.uk/ictari/ictari.htm

and have a read of ICTARI 47.

Those of you who've been reading up on OLGA and the like in
Atari Computing will be intesested in the huge chunk of GEM
documentation in ST-Guide format. As for next month, I don't
know.... Send me something ?

Have Fun,

Giles.

> I was (specifically, TTP programs).
You said that one should stop writing TTP-programs and think of using the commandline as being bad practice which should be avoided, not restricting the latter to using it as a user interface.

I don't subscribe to either point of view, because TTP programs are often faster (not only in terms of execution time, but also regarding the time you need to tell the program what it should do), may be used in the Auto-folder as well, and are often the only senseful solution to a problem. Would you write an input/output filter which is only used as an overlay for a GEM app with a GUI of its own? Of course, when it comes to full user interaction, a GUI should be used whenever possible.

And I also don't think of using the commandline is bad programming practice (and I include AGRV to that, as it's just a way to expand the length of the limited basepage-commandline). You can drop files (and not only one) onto an app's icon, or you can for example use it for some special features of the application which don't involve the user interface or to allow "power users" to get the most out of the program.

> OTOH, allowing the desktop to
> pass 1 filename via the command line is part of the GUI, and SHOULD
> be implemented.
So I ask you again: If you want to edit three files, you drop one onto the editor's icon and open the remaining two files via "File: open"? Even Atari's Newdesk allows dropping more than one file, so why should one restrict it?

> g > Never heard of the ARGV-parameter-passing-scheme?
> I mentioned passing arguments using environment variables.
ARGV is realised by using an application's environment, but you don't put the arguments into environment variables. You may call that nitpicking, but with only speaking about environment variables, I don't automatically think of ARGV.

> In any case, the issue turned out not to be the 128 byte limit, but
> rather replacing Fsfirst() with Readdir() and Fxattr(). (Help with
> MiNT filenames)
Which I also replied to ;) But it's also important to think about the commandline (and the Drag&Drop protocol) when dealing with long filenames, because these may contain spaces and then have to be quoted (not in the ARGV environment, but in the basepage's commandline, which has to be filled anyway).

Ciao

Thomas

Hi guys, I need some help with GFA too.

Is there a utility to convert gfa 2 to 3.5 out there?

> the transition to supervisor mode.

You remember well:don't even try to use MONST to trace a TRAP routine!

Thank you for all those informations.

BTW, when the interrupt reaches the RTI, no register (except SR) is
modified,I guess?

Hi everyone,
I've got another one of those silly VDI questions...

I need to write a routine that will plot pixels (or an entire row of pixels at once) using the VDI in any video mode. As I see it, I have two options:

1 - Use v_pline to draw each pixel seperately. Sounds a bit slow...
2 - Build a bitmap in standard format and then use the VDI transform function. At first this sounds a bit more advanced then the method described above, but... What is the format of a standard bitmap for, say, 24 bit pixels? If it is what I fear it is (24 seperate lines, one for each bit) then that would mean that, in order to write 16 pixels in a row, I would have to read 16*3 = 48 bytes (to get the color values in RGB) and write 24 words (again 48 bytes) which
    a) need lots of shifting, ANDing and ORing, which uses up a lot of CPU cycles
    b) don't fit into the registers, so would have to be constructed in memory (which is awfully slow when using ST-RAM)
    All this would make it even slower than a single-pixel plot routine for an 8-bit interleaved screen :-) (Yes, I've got a Falcon, which uses this silly mode that only Atari (or Amiga) could have invented...)
    (Well, not exactly invented, but thought handy enough to put into their video hardware anyway...)

Well, anyone else got any better ideas on how to use the VDI for fast flexible plotting? Or is it just not possible... (I suspect the latter ;)

Don't forget that this is only true for the 68000. On > 68000, the vector
number is also stored on the stack (IIRC in step 4b, but I may be wrong).
That's why old trap handling programs didn't work on the TT, if they
expected parameters on the stack.

Ciao

Thomas

> And how does one do that?
Mhmm, I can't promise everything I tell you will work flawlessly with
Gfa-Basic as well, but at least it should be possible to achieve it.

First, call wind_update(BEG_MCTRL) to grab the complete mouse control.
Then get the current mouse position by a call to evnt_multi() with a 1 ms
timer-event (MU_TIMER), which will also give you the mouse coordinates.
After that, use evnt_multi() and wait for the release of the mouse button
the drag operation has been started with (MU_BUTTON), and for a
rectangle event (MU_M1) that occurs when the mouse cursor leaves a
rectangle with x = last mouse x-pos, y = last mouse y-pos, and w/h = 1.
If you get a button event, the loop is finished (don't forget to call
wind_update(END_MCTRL) afterwards). Otherwise, draw your stuff and use
the current x and y position of the mouse for the rectangle in the next
call to evnt_multi().

If you want some sample code (either C or Gfa), tell me, as I don't have
the evnt_multi()-docs here (respect to those who are able to remember all
the parameters) ...

> If I remember correctly, the GFA drawing commands also turn off the mouse.
> He probably used them.

Maybe. I only use Gfa to quickly test some algorithms, but not for real programs. So I hardly ever use the graphic commands.

Ciao

Thomas

P.S.: You should check your newsreader or the server, as your posting contained the complete article twice ... (It really seems to be a problem of the server, as the second arcticle contains a mail header with the subject "Local Post".)

Sorry, the ST/Falcon will not support ZIP on the parallel port. The SCSI connection is fine, though :)

As a matter of fact I just have the same problem. I wanted to use my //
Zip drive (initialy for my Pc) to save all my Atari files. I asked the
same questions two days ago, and I get the same answers everywhere.
So i transfered all files via null modem cable (with ZModem protocol) on
my Pc and then saved them on my Zip drive.

But perhaps there is a better solution i still didn't try :
- connect the Pc and the Falcon with a null modem cable,
- use Ghostlink to use Pc as a slave.
- consider all the Pc peripheral devices as Falcon peripherals.
Actually, I will try this idea this week-end, so if you do it before
tell me so.
If you have questions or suggestions about this procedure just tell me.

Wilfrid, FRANCE !

PS. If my English is quite incorrect, please forgive me and help me ...

Hello, I am interested in getting into assembler programming on the ST. I need to know where I can get information on programming the operating system and the hardware (not that I intend to program the hardware directly, it is more for interest).

I already have 68K programming experience with my Amiga so do not need any information on programming the machine code itself.

Thank you for your time.

Get "The Atari Compendium" it covers operating system and the hardware.

Do you mean RTE?
If so, when this instruction is reached, the old SR and PC will be
restored from the stack. No other registers are modified.

Yes, sorry, I'm being traumatized by TMS 320 C 30 assembly language!

Perfect!
I think I should buy a good book about the 68000!!!

This is a BAD thing for compatibility!
Thank you very much! I'll left the stack then and ask parameters by registers! It will be compatible from the good old 68000 to the great 68060!

  Start with the Atari Compendium...it covers all versions of TOS and is
  available in book or CD-ROM (HTML format) form... Good luck, and have
  fun! :)

Well, with TOS and compatible systems, there's no real need to do so, as you

can rely on the OS variable _longframe. If it's non-zero, than the running CPU uses the long stack frame (i.e. with the vector number).

But don't forget to check if the trap was made from user or supervisor mode, as the parameters have to be accessed via the USP, then.

Of course, if your trap handler is not intended to run under TOS-compatible systems, you can't use _longframe. Btw, I don't have the address of _longframe handy, but I can look it up. Or maybe someone else can supply it.

Ciao

Thomas

b > what's EXACTLY happens when a TRAP is called

An exception stack frame is pushed onto the supervisor stack. For the 68000, this consists of the status register and return address (6 bytes). For the 68030, it also includes the exception vector number (8 bytes total).

The CPU switches to supervisor mode (interrupt mode on the 68030) and jumps to the address in the corresponding exception vector (first 256 longs in RAM).

Remember that A7 now refers to the supervisor stack. You might also have to worry about MMU effects to be compatible with MiNT and possibly OUTSIDE (for 68030).

The RTE pops the exception stack frame, restoring the original

status and PC register values. Note: if you were already in
supervisor mode before the exception, you will still be in
supervisor mode after the RTE.

menu_attach() allows a submenu to be attached to a menu entry, so that
when the mouse pointer moves over that entry, the submenu appears. For
further information you may like to consult an up to date reference on the
Atari AES, such as the Atari Compendium.

Instead of ghostlink you should try Parcp, which is a similar tool but
uses the parallel-port instead. It also multitasks with Win95 and I
believe it's available for Linux as well. The downside here is that unless
you have two paralellports (Many PC's have.) you need some way to switch
between the Zip and Parcp's cable.

If you have more than one paralellport you can save directly to the Zip.

AFAIK, that's already true for >= 68020.

> and jumps to the address in the corresponding exception vector
> (first 256 longs in RAM).
Not necessarily. On 68030 (maybe already 68020), there's the vector base register (VBR). So, in fact, the address the CPU jumps to is VBR + 4 * vector_no.

Ciao

I've made a title screen in DEGAS and want to load it into memory. Once in memory I want to display the picture on the screen very small(Like its far away) and then zoom in on it(Getting bigger until it fills the screen). As the picture is being zoomed in on I want to rotate it, spin it e.t.c. How is this done? Can I use the GET/PUT commands and how about using the screen flipping thing draw to logic and then copy to the physical screen. How is that done?

Any help would be greatly appreciated.

As well anyone know where I can download some good examples(source code) for GFA BASIC.

E-Mail: e63sah@morgan.ucs.mun.ca.

Thank's..... Scott

hello,

I wonder if there is any scsi library which allows to read/write to
generic scsi device (as under linux) or at least to write aANY commands to
scsi cdroms/cdr's.

regards,

szymon.

Agreed, I have both & I _always_ use the book. It now has many loose &
lost
pages - so I would be interested in buying a new one. Anybody know where
I can
get it - I understand it is out of print...?

In order to achieve what you want to do, you'll need to write a Degas loader routine, this has been documented many times, and really isn't a difficult concept when you have the info on how the file is structured, and how the ST handles colour. To get a blow by blow of the Degas formats get a hold of the text file called PIXFMT.TXT it's one of the best descriptions of Atari graphics formats.

If you use the GET/PUT commands you risk your program not working on other machines because the GET/PUT make Line-A calls (or at least this is what I've read). Better to use the VDI blit routines vro_cpyfm(). If you don't care about Line-A calls then GET/PUT, or BITBLT which is faster than PUT/GET, are fine. There's also something called RC_COPY, but that seems to be related to window handling.

Finally you'll need some sorts of image processing algorithms. One for rotation and one for resizing an image. I suggest the library for finding this information. Back issues of Byte had lots of interesting technical info on image processing. Of course using a screen buffer (screen flipping) is a good idea to fool the viewer's eye into seeing a seamless animation.

Animation brings up another good point. If you have a program like Cyber Paint, you could do the whole intro as a SEQuence animation, and simply load that file and play it. GFA would simply do the load and play back, and you wouldn't have had to muck about with raster image transforms.

Later...

Actually, the Atari Compendium is not an online document but a book, also available in CD-ROM form. Let me tell you, you want the book not the CD-ROM, though - the CD-ROM version is very poorly done and extremely difficult to use (IMHO).

Why not take a look at the CBHD archive?

As well as the driver, configurer etc. this contains a s/w SCSI interface which can be loaded at run time together with a description of how to write code for this i/f.

Fast? No! flexible? well...
There is another VDI call, v_pmarker, which can be set to plot single pixels. As with v_pline you give it an array of coordinates and it will plot pixels at each coordinate.

The method of building a bitmap and use VDI calls to put it on screen might be faster if you have a lot of pixels to set.

Greetings,

Tomas

Hello everyone,

I tried to install the newest GNU binaries (is that 2.5.8?) on my Falcon and suddenly I had all sorts of problems with files that could not be found. It appears to be a communication problem between Gulam and GNU, i.e. somehow the new GNU works with unix style '/' instead of dos style '\'.

Anyone to confirm this??
Anyone know a unix-like shell or other sollution to this problem?
Couldn't set myself to install Linux yet.

greetz,
Vince

With the apparent progress towards GEM being more multi-user friendly, much software stores its settings in the user's home directory. This is, of course, an excellent thing, but there are still some irregularities.

For example, some software stores the settings files in a directory called "defaults" in the users home directory, while other software stores the settings file directly in the home directory.

Also, since the concept of storing the settings in a home directory seems to be derived from UNIX, should be also derive the file naming convention from UNIX; i.e. the settings for an app called "test" would be stored in a file called ".testrc"? Or should we name the files more like "test.rc" or "test.set"? The trouble with the latter approach is that a user's home directory soon gets very cluttered with settings files, whereas under the UNIX convention, these files would be hidden (since the name begins with a '.' character). However, the UNIX naming is not very useful under a MS-DOS style filesystem, where a filename such as ".testrc" would be truncated to ".TES".

Also, since many GEM users do not have a multiuser system, it is quite likely that the user may not have any home directory. Where should the settings files be put in this case?

I posted about this some time ago but received no responses. I believe it is important, however, that a standard system for placing and naming settings files must be constructed in order to avoid the difficult problem of a variety of systems being used.

I would be interested to hear any comments anyone may have on the above.

All the usual UNIX shells are available for MiNT, i.e. sh, bash, csh,
tcsh, zsh...

I have a fairly complete UNIX style setup of MiNT, and never observe
problems like those you mentioned.

Check out Steffen Engel's SCSI library which comes as part of the CBHD
driver package. You can download it from any good Atari ftp site; here
are just two links:

http://www.funet.fi/pub/atari/diskutil/cbhd502.tos
ftp://ftp.uni-paderborn.de/pub/atari/tools/hd/cbhd502.tos

I recently purchased a used Atari 800 with very little programming
documentation. I need to know any programming commands (is it the same
as C64 basic) and the pin configurations for both the joystick ports and
the periferal ports, I also need the commands to access the ports.
Thanks in advance Adam.

If you are working with only one color (at a time), you can use
vrt_cpyfm() and only have to deal with one simple (mono) raster
image.

Is there anyone out there to advise me how one makes
double size fonts from GDOS fonts (bitmapped). For my TelVYT102 I need
to be able to scale fonts to be
1) double width
2) double height,
and if possible
3) top and/or bottom halves of double size fonts.

Can anyone help?

Boris

Mario Becroft (mb@tos.pl.net) wrote:
: Also, since the concept of storing the settings in a home directory seems
: to be derived from UNIX, should be also derive the file naming convention
: from UNIX; i.e. the settings for an app called "test" would be stored in a

: file called ".testrc"? Or should we name the files more like "test.rc" or
: "test.set"? The trouble with the latter approach is that a user's home
: directory soon gets very cluttered with settings files, whereas under the
: UNIX convention, these files would be hidden (since the name begins with a
: '.' character). However, the UNIX naming is not very useful under a MS-DOS
: style filesystem, where a filename such as ".testrc" would be truncated to
: ".TES".

Tell me about it... Under MiNTOS, the version of 'tcsh' I use insists on
having 'tcsh.rc' files and refuses to recognise '.tcshrc' files (I'm abviously
using the Minix filesystem).

: Also, since many GEM users do not have a multiuser system, it is quite
: likely that the user may not have any home directory. Where should the
: settings files be put in this case?

I'm not sure that this is really a problem: if there are no users on the
system then you may only use the system with 'root' permissions. In these
cases the configuration files usually reside in an 'etc' directory (either
/etc or in /local/etc). Config files found here are generally read first by
most UNIX apps (others provise facilities to include standard config files
in the user's own).

: I posted about this some time ago but received no responses. I believe it
: is important, however, that a standard system for placing and naming
: settings files must be constructed in order to avoid the difficult problem
: of a variety of systems being used.

I have been giving issues such as these some thought. Basically, I believe
that UNIX has got config files right: stick standard ones in '/etc' and
'/local/etc' and the user has their own in their $HOME directory.

This works even if their is only one user on the system (you only have the
config files in /etc and /local/etc) and can be made to work with M$-DOS
filesystems by making the apps looking for config files look for '.testrc'
first, then 'test.rc'.

Well, you asked for comments!

Cheers,

James Cox.

The "Format Word" debuted with the 68010.

So, at the start of the trap handler, the supervisor stack looks like this:

```
ssp+0:  SR  (2 byte word)
ssp+2:  Return address (4 byte longword)
ssp+6:   Format word (2 byte word)
```

If you are running on a 68000 or 68008, then the format word does not exist.

However, if you are using a 68010+, _DO_NOT_ alter the format word. You will get a "Foarmat error" with 14 bombs.

> vector_no.

The VBR also arrived with the 68010. This allows the exception table to appear anywhere in memory - not just the first 256 bytes

_longframe = $59e. (1438 decimal)

This is a word (16-bit) value.

If it is zero, then the stack frame is 6 bytes long, otherwise eight bytes.

The "Format Word" debuted with the 68010, lengthning the 68000/68008 stack frame from six bytes to eight.

DO NOT alter this word, as you will get a "Format Error" exception (14 bombs under TOS) at the next RTE

> > and jumps to the address in the corresponding exception vector

> vector_no.

The VBR also debuted on the 68010 - allowing the exception table to appear anywhere in physical memory, not just the first 1024 bytes.

Summary: MiNT Component Manager -- release details
Organization: University of Sussex
Keywords: MiNT OS Fenix component module framework
Newsgroups: comp.sys.atari.programmer

Well, after three years and a fair few promises of an early release, my component manager is finally ready (funny how this coincides with my end of my degree :).

I have the package sitting on my hard-drive at the moment in the form of a tar-ed, gzip-ed archive but I don't know which FTP site to upload to! I want to get this out and available as soon as possible since I don't have all that much time left at University (I have until the 27th of June).

There are a few people who I am going to email about putting it on their FTP sites, but I would welcome any suggestions for where to distribute it from.

I suppose I should tell you what is so good about the component manager then...

The thing was born out of the fact that MiNT has no support for shared libraries, and I didn't like the fact that quite a few programs share the same basic source code for certain functions (at a mundane level, string handling for example). So I started work on building a program that would load and unload standards bits of program code that provided system wide libraries of functions.

This turned into something which, in my opinion, should be a part of the operating system. At this point I should mention Sven Karlson's (sp?) project to create an entirely new operating system for the Atari: Fenix. The kernel is very small with Fenix, and all of the device drivers, filesystem drivers, etc.. are implemented as 'servers'. These servers are loaded as needed and help make the overall size of the kernel _very_ small.

The component manager that I have constructed is built with this in mind: most components are 'non-resident', that is, thay may be unloded from memory if no client wishes to use it (some components would have to be 'resident' since they might patch into an interupt vector, for example).

The component manager provides a simple interface between clients and the components that is very 'open'. Components can have whatever protocol they wish for providing their function(s). It is upto the documentation about how to use that 'class' of component to detail how to interpret the protocol.

Anyways, enough of the boring details... The component manager is a tiny archive: the actual program is only 5700 bytes of so on disc, although uses about 40K of memory (with memory protection turned on). My next concern is finding someone who will distribute the system around. If anyone would like to volenteer some FTP space for it, it would be most appreciated.

Sven: if you read this, get in touch with me if you want more technical info on how my component system works: I'm not releaseing source codes for my first version of this (whilst it is stable, it is not really complete yet).

Cheers,

James Cox.

I don't remember reading anything in Sozobon about C-desk. What is the
latest version of Sozobon? X?

This is probably true. Here, it's the user definable stuff like the
various types of cache and their sizes which is the unknown quantity.

>well I
>have to keep on the safe side so will make it a maximum 3.5meg,

I'll assume most of this space is for graphics - what about having
some of the disk files compressed and expanding them immediately
after loading, or does STOS do this anyway?

> And thanks there mate... suprisingly none responsive audience for
>this one.. perhaps the question was far too difficult ;--))

hehe! methinks it's more a case of too much trouble to disable
everything! ;-)

There is another solution (albeit less elegant): set the mask and
state both to 0, in which case it will return on ANY button event.

Hi,

Can someone give me an advice how to handle long file names like the
ones used by MagiC and MiNT. Right now I'm reading the path and filename
from the basepage (the parameter/command line) but it doesn't work very
well when long file names are used.

Thanks,
Daniel Hedberg

It isn't undocumented. It has been for a long time, but Atari decided to
document it and AFAIK it's also mentioned in the Compendium.

Ciao

Thomas

No, it will always return from the evnt_multi()-loop immediately, with 0
as the pressed button mask if no button has really been pressed. This
will awfully slow the application down (and even worse, it will slow down

all other applications in a multitasking environment as well), so I really recommend not to use this method.

Ciao

Thomas

P.S.: The above holds true for TOS 1.02, but I wouldn't bet all AES react the same with this (now really undocumented feature), so it might be that for example N.AES returns no button events at all, MagiC behaves like TOS 1.02 (i.e. "endless" events), and MTOS only reacts on real button events.

It sounds like you want to extract a long filename which has been passed as arguments to your app.

The method for doing so is no different to usual - the method for obtaining the commandline is not affected by what data is in the commandline.

However, to make proper use of long filenames, you will need to ensure that you are running in the MiNT domain with Pdomain(DOMAIN_MINT). This tells the OS that your app understands things like long filenames.

You will also find that you cannot use the Fsfirst() and Fsnext() functions for getting a directory list, since these only support MS-DOS style 8+3 filenames. Instead, you need to use Dreaddir() and related functions.

Apart from this, I don't think there should not be much that needs to be handled differently. Just remember that everything is case sensitive and that you need to allow room for the long names.

There is one other thing to think of, though, and that is quoted filenames. With filesystems like the Minix filesystem, which allow spaces in filenames, quoting of filenames must be used where filenames contain spaces. Otherwise, there would be no way of distinguishing one filename from the next in a space separated list. Therefore it would be advisable to support filename quoting in your app. This may be useful when receiving filenames on the commandline or perhaps from a fileselector, AV protocol message or other source.

The quoting is quite simple, and works as follows:

* Filenames are surrounded by the apostrophe character `''.

* Where there is an apostrophe character `'' in the filename, two such characters are inserted in its place.

So for example, the filename:

This isn't a good example of a sensible filename

when quoted would read:

'This isn''t a good example of a sensible filename'

I hope that was of some help.

I recently installed AMCGDOS on my MEGA STE. I can't seem to print pictures from CAB 1.5v only text. I believe I need something called a META.SYS driver (meta file driver). What is this and does anyone know where I can obtain one?

I wasn't sure where to put this message so if this was the wrong place sorry :)

Scott

d > when long file names are used.

The first question is, what is writing the command line?

If the desktop is doing it (e.g., dropping a file on the application icon), then you don't have much control.

If you are writing TTP programs, stop doing that! Think of command lines as a bad programming practice, maintained for backward compatiblity. Call fsel_input() to get any file names.

If you are writing parent/child programs, there are many ways to pass info between processes. My favorite is to replace the environment string pointer in the basepage with a structure pointer. My least favorite is to pass the info with an environment variable.

Mario Becroft (mb@tos.pl.net) wrote:
: Daniel Hedberg (dhedberg@aristotle.algonet.se) wrote:

: : Can someone give me an advice how to handle long file names like the
: : ones used by MagiC and MiNT. Right now I'm reading the path and filename
: : from the basepage (the parameter/command line) but it doesn't work very
: : well when long file names are used.

: It sounds like you want to extract a long filename which has been passed
: as arguments to your app.

Correct.

: The method for doing so is no different to usual - the method for
: obtaining the commandline is not affected by what data is in the
: commandline.

No, I've figured that out! 8-)

: However, to make proper use of long filenames, you will need to ensure
: that you are running in the MiNT domain with Pdomain(DOMAIN_MINT). This
: tells the OS that your app understands things like long filenames.

Hm, I'm not very familiar with the MiNT calls, but I do have the Atari
Compendium and if I remember correctly they are all covered by it.

: You will also find that you cannot use the Fsfirst() and Fsnext()
: functions for getting a directory list, since these only support MS-DOS
: style 8+3 filenames. Instead, you need to use Dreaddir() and related
: functions.

Okay, I'll check up on the Dreaddir() call. Right now I'm using the
Fsfirst() call to find out the size of the file. I guess I'll have to

figure out some other way to do it with long file names.

: There is one other thing to think of, though, and that is quoted
: filenames. With filesystems like the Minix filesystem, which allow spaces
: in filenames, quoting of filenames must be used where filenames contain
: spaces. Otherwise, there would be no way of distinguishing one filename
: from the next in a space separated list. Therefore it would be advisable
: to support filename quoting in your app. This may be useful when receiving
: filenames on the commandline or perhaps from a fileselector, AV protocol
: message or other source.
:
: I hope that was of some help.

Many thanks Mario! Your help is much appreciated!

Thanks,
Daniel

OK, I know it's not very wise to use it, but how does a (X)IMG file
look like for screens which use packed pixels (ie. >256 colors)?
Come to think of it... How does a standard bitmap look for such a mode?
Is a 16 bit color mode bitmap line, for instance, seperated into 16
lines of one plane each? (That would be logical...and horrible!)
And what about overlay bits?

I have got 3293524 bytes at a 'normal' boot and 3785514 bytes at an everything free boot. I you want to have maximum free memory with harddisk drivers enabled use a RAM bootsector and take over full control after the harddisk is booted. (The RAM bootsector is executed after the harddisk has booted but before the autofolder is executed.) I am still wondering why Falcon demo crews don't use this trick to get maximum free and clean (no NVDI and so on) memory on the Falcon.

I think 3.5 Mb is a workable amount, still leaves some place for things that make life on a harddisk system easier.

Bye, Hans Wessels

Hi,

This is a Solicitation Email, we are looking for new TUFF'97 DISTRIBUTORS. TUFF'97 is a promotional concept for a prospect follow-up system called "Simple Track". Software designed for Windows 95, 3.11 and NT machines. (Macintosh users read the NOTE below(*))

Concept:

The TUFF'97 software includes a copy of Simple Track, so you can use this for your own personal administration (free). However, the TUFF'97 software is designed to give you BIG TIME credits for just taking the efforts to PROMOTE it.

How do I get those credits?. Easy, just distribute/promote it. How? (Give away the software for free, put it on your website/homepage and let everyone download it. Give it to your friends, attach it by email etc). With a one time $40.00 (USD) validation code purchase, YOUR name becomes part of all sofware you sent out to your customers. When your TUFF'97 software gets validated, all your personal information is automatically integrated in the software, so everyone knows how to reach you by phone/fax or email and where to sent the check/money or cash orders.

Basically this is the concept. Offcourse you need the software to grasp the whole thing. Believe it, there is absolutely no marketing knowledge required, just ask for the software package, join and start promoting your own TUFF'97 line. The only thing you DO need is a PC or Mac(*) and Internet.

(*) TUFF'97 is only available for MacOS users running Connectix VirtualPC or Insignia's Sofwindows 95/3.11. A true MacOS version is not available.

When you're interested in becoming a TUFF'97 distributor and create your own distribution line, sent a mailto:FiReStArTeR@frodo.com and ask for your copy of the TUFF software (We'll sent you a download location and install instructions). This is a serious opportunity, so only serious responses are processed. If you're not interested, have a nice day.
Best Regards,
Tony Scott

schwab@issan.informatik.uni-dortmund.de (Andreas Schwab) writes:
> Use Fxstat().

That's Fxattr() :)

The best way for all this (in C) would be to use the MiNT-lib (the version with most MiNT-cookie-checks removed) and its UNIX/POSIX-conforming calls. For example, To check for a file's length, one would use stat() or lstat(), which will always use the best function call available (i.e. Fsfirst() with plain TOS, Fxattr() with MiNT/MagiC and alikes).

Ciao

Thomas

Ah yes, so it does! OTOH, I couldn't get the bmask = 0x103 to work at all (other than to press both buttons), using either TOS 3.06 or Geneva (AES replacement).

Can anyone give me some code on how to use vro_cpyfm() VDISYS 109, vrt_cpyfm(): VDISYS 121, and the vr_trnfm(): VDISYS 110. Or tell me what each means and how they work?

Hi!

In article <e18_9706161311@conchbbs.com>,
     John.Kormylo@7861.conchbbs.com (John Kormylo) writes:
> OTOH, I couldn't get the bmask = 0x103 to work
> at all (other than to press both buttons), using either TOS 3.06 or
> Geneva (AES replacement).
It's not bmask you have to add 0x100 to, but the number of clicks. Also, you have to wait for the release of mouse buttons, the 0x100 "inverts" the meaing of bstate, i.e. "wait for left or right mouse button NOT being released -> pressed". E.g., to wait for clicks and double clicks of either the left or right mouse button, use 0x102, 3, 0 as parameters for evnt_button() or evnt_multi().

That's the trick.

Ciao

Thomas

You could take a look at the sources of my color icon routines, which make extensive use of all the three. Though I haven't uploaded the archive of the latest version yet ...

Some short information about the calls:

vro_cpyfm(): VDI raster copy, opaque
Allows you to copy rasters (rectangular areas described by MFDBs, memory form definition blocks) in device-dependent format from screen to screen, screen to memory, memory to screen or memory to memory. There are quite a lot of copy modes possible (invert, or, and, etc.)

vrt_cpyfm(): VDI raster copy, transparent
Allows you to copy one-plane rasters from memory to screen or memory, selecting between four modes (replace, transparent, reverse, and reverse transparent) and two colours for those pixels which are set and those which are cleared in the source raster. Again, both rasters have to be in device dependent format.

vrt_trnfm(): VDI transform form
This call allows you to transform rasters from device independent (i.e. standard) into device dependent format, and vice versa.

Ciao

Thomas

Got it; (button & bmask != bstate) when (bclicks & 0x100).

Add this to the Compendium errata list.

Word has been received that this year's MIST Atari show will be held on Saturday, July 26, in Indianapolis, Indiana. The organizers say this show, the ninth annual, will be the final one.

This year MIST is moving to the Post Road Community Center, 1313 South Post Road, on the east side of the Indianpolis area. The new location is between I-70 and I-74, outside the I-465 circle freeway.

Show hours are 10 am to 3 pm, Indiana time. Admission is one dollar. In past years this show has had displays by vendors, hardware and software developers, magazine publishers, and users groups. All kinds of Atari computers and related products can be found at these shows.

Organizers of the show are: Charlie Sears (317-535-4829), csears at doe dot state dot in dot us. Jeff Hammer (317-244-8492), jghammer at indyunix dot iupui dot edu. Stu Huffman (812-988-7558), shuffman at doe dot state dot in dot us.

> And what about overlay bits?
Picture file format dont' depend on the structure of the screen. In
fact, an IMG/XIMG file has teh stucture for an ATARI screen. Si if your
screen is a 256c Falcon screen, that's good. If your screen is a 256c
packeb byte screen, you have to transfom the piscture before displaying
it.
The problem is the same in TC mode: a Falcon in TC16 is RRRRRVVVVVVBBBBB
as a Macintosh (running with Magic eg) is xRRRRRVVVVVBBBBB so you have
to translate your picture.
We've made such routines for loading, dithering and so on.
Take a look a our web site for that.

Oh at first, I think that' AMCGDOS is not a free-bug software. Just
prefer NVDI or SPEEDO, that's better.

An 'instal.inf' file could also be saved on the floppy disk from where
the
installation was made (which at its simplest could be a recording of
every
action/keystroke taken during the installation) as well as in the
directory
of the newly installed 'program' maybe something like ease.ins for Ease?
Redundancy, I love redundancy. :^)

In the program I am currenty writing I'm wanting to be able to load
seperate modules to the program so new features can be added with the
addition of a module. The modules will all be loaded when the program
is first executed.

Would the best way to load them be into 1 large memory block or load
each module into its own block of memory taking into account memory
fragmentation?
The problem I see with using 1 block is that if memory is badly
fragmented then the block may not be allocated even if the system has
plenty of ram free.
The memory is being allocated using m_alloc()

David

You were not doing it quite right. Remember that this feature is frequently misdocumented. When I tried to use it, I got three different explanations of the feature, none of which were correct! I hope the following is correct, however, since I have tested it.

The correct method is to OR 0x100 with clicks while setting mask to cover all the buttons you want to watch. So to wait for the left and right mouse buttons doing either one or two clicks, clicks = 0x102, mask = 0x3.

I hope this clarifies things.

But you don't need any more "control" than what you have got. What more control could you have, or want?

: If you are writing TTP programs, stop doing that! Think of command
: lines as a bad programming practice, maintained for backward
: compatiblity. Call fsel_input() to get any file names.

I can't imagine why you could call commandlines "bad programming practice" or suggest that people should stop using them!

All software should, where relevant, be able to take parameters and/or filenames on the commandline.

There is no problem with getting "long" filenames on the commandline, just the same as there is no problem with short filenames, middle sized filenames or anything else.

  I guess I ought to clarify this. I don't mean create a new font,
I mean to display a font on the screen in double size.

Usually test.inf or test.dat (but almost any extension will do). Nor is the practice peculiar to or derived from UNIX.

Same directory as the application.

well, I've got something like this...
there is only 2 minor trouble:

-It is a .TAR file (You can manage to read it with a good text
editor,even if it doesn't look very pretty)

-It's over 1.5 Mbyte! Even packed with ZIP, it is not far from 300 Kb...

So, having read the article by James Cox, which seems quite sensible to
me, reading the configuration file would go something like this:

Try ~/.appnamerc
Try ~/appname.rc
Try /etc/.appnamerc
Try /etc/appname.rc
Lastly, try appname.rc in the current directory (where the app was started

from). This is necessary for people who don't have a UNIX style directory tree.

But, where should the settings be saved to? Perhaps they could be saved to the same place they were loaded from, but what about when there were none to load?

Also, what happens to the ~/defaults directory, where some apps store the settings?

I suppose you could simply change the size with vst_point() or vst_height(). To get the halves, you could use vs_clip() to clip the drawing to one half of the font, perhaps.

Why not use the VDI call for setting a font's height, i.e. vst_height() ?
Better still, use vst_point() !

Cheers Peter

erm, offhand, I don't recall a command for this - you'll need to have
a double width font.

>>2) double height,

vst_point or vst_height.

>>and if possible
>>3) top and/or bottom halves of double size fonts.
>   I guess I ought to clarify this. I don't mean create a new font,

btw, bitmapped fonts can only be scaled to a maximum of twice their
original height.

My current project is to use as much memory as I can on a bare bones
4meg STe or Falcon,

The only thing not to be turned off (trying to insist on a clean
boot) is the hard drive control fing,

Currently the game is taking 2.7 meg.. but more animation to come,

QUESTION, How much memory do I need to leave free for the HD
controller?, is it minimal as in a few K, or is it like quarter to
half a meg or something ?

I do not have a HD so testing for the result is impossible :)

The game has been succesfully tested and breezes through everything up to and including a Falcon with Nemesis, but a clean system is prefered, I presume the HD controller is the minimum, nothing else desperatly needed to boot the old Falc is there...sorry I havent got one of them either :)

Cheers !ynoT (ATARI Programmer)

That's fine.

> QUESTION, How much memory do I need to leave free for the HD

Difficult to say specifically. It depends on how the driver is set up. If memory serves, I can get round about 3.5 meg although I can't remember if that's with or withoot Zcontrol, probably without. As a rough guess, I'd assume 3.2Mb.

> I do not have a HD so testing for the result is impossible :)

Mine refused to boot today - got me rather worried until I spotted the
hd end of the dma cable had unplugged itself and was lying on the
floor. Must have forgot to screw it up when I moved the computer! ;-)

Well, nobody would want to mess with their driver settings so I guess
the best thing to do is just see what the highest setting is for a 4mb
machine - who cares if a driver takes 1Mb on a 14Mb Falcon eh? <G>

Mario Becroft (mb@tos.pl.net) wrote:

: With the apparent progress towards GEM being more multi-user friendly,
: much software stores its settings in the user's home directory. This is,
: of course, an excellent thing, but there are still some irregularities.

Yeah, I've been thinking about this kind of multi-user problems too
lateley... There are more. What about, for instance, the RSC files?
It wouldn't be very appropriate to store them along with the binaries
in /bin, /usr/bin or /usr/local/bin, would it?

: For example, some software stores the settings files in a directory called
: "defaults" in the users home directory,

Hmm, that's a nice idea...

: However, the UNIX naming is not very useful under a MS-DOS
: style filesystem, where a filename such as ".testrc" would be truncated to
: ".TES".

Actually, MinixFS will convert ".testrc" to ",testrc"
But it would be nice if MinixFS were to convert every file starting with a
dot to a hidden DOS type file (with the dot removed)...

: Also, since many GEM users do not have a multiuser system, it is quite
: likely that the user may not have any home directory. Where should the
: settings files be put in this case?

A program should probably check for a homedir (environment var. HOME)

and if none exists (ie. no multiusersystem!) use the current (app) dir.
Every multiusersystem should have homedirs...
In a Unix type FS one should use /etc for general preferences, as far as I know.. (You could check the Linux Filesystem Standard, it'll shed some light on Unix type filesystem trees.)

: I posted about this some time ago but received no responses. I believe it
: is important, however, that a standard system for placing and naming
: settings files must be constructed in order to avoid the difficult problem
: of a variety of systems being used.

I agree...

: With the apparent progress towards GEM being more multi-user friendly,
: much software stores its settings in the user's home directory. This is,
: of course, an excellent thing, but there are still some irregularities.

Yeah, I've been thinking about this kind of multi-user problems too lateley... There are more. What about, for instance, the RSC files? It wouldn't be very appropriate to store them along with the binaries in /bin, /usr/bin or /usr/local/bin, would it?

: For example, some software stores the settings files in a directory called
: "defaults" in the users home directory,

Hmm, that's a nice idea...

: However, the UNIX naming is not very useful under a MS-DOS
: style filesystem, where a filename such as ".testrc" would be truncated to
: ".TES".

Actually, MinixFS will convert ".testrc" to ",testrc"
But it would be nice if MinixFS were to convert every file starting with a
dot to a hidden DOS type file (with the dot removed)...

: Also, since many GEM users do not have a multiuser system, it is quite
: likely that the user may not have any home directory. Where should the
: settings files be put in this case?

A program should probably check for a homedir (environment var. HOME)
and if none exists (ie. no multiusersystem!) use the current (app) dir.
Every multiusersystem should have homedirs...
In a Unix type FS one should use /etc for general preferences, as far as I
know.. (You could check the Linux Filesystem Standard, it'll shed some light
on Unix type filesystem trees.)

: I posted about this some time ago but received no responses. I believe it
: is important, however, that a standard system for placing and naming
: settings files must be constructed in order to avoid the difficult problem
: of a variety of systems being used.

I agree...

I have an atari 800. It's been in a milk crate for several years and I need the closet space. I'd hate to leave it on the curb. So, if anyone can give it a good home. Please let me know. I live in Greenwich Village, New York City. I don't want to have to pack and ship it, so if you're interested, you would have to pick it up.

Not to my knowledge. Their might be some NVDI call or something but if
there is I've never come across it.

Assuming there is no call, perhaps Connect is getting round the
problem by generating double widths on the fly. I'm guessing here but
it might print offscreen, call some code to double the width, then
blit the result back to the screen. Alternatively, it might fiddle
with the font header and/or table and fool gdos. Perhaps it prints to

a virtual screen half the width then blits it back somehow? - I really
dont know.

If somebody has a solution please enlighten us!!

X-Deja-AN: 245775425
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.programmer

I have recently obtained KP SACK (SAA Construction Kit) in order to add
SAM support to my applications.

It appears that for the application to make use of SAM, the _user_ must
install the SAA file.

It would be better if the installation program could do this. In fact,
ideally the user should not have to do anything at all to install a
program, except run the installation program.

How can this be accomplished, with regard to SAM and SAA files? Is there
some method of installing these files in a manner such that user
interaction is not required? Naturally the user will have to assign the
actual sounds, but the user should not have to worry about installing the
SAA file.

Keywords: non-interactive installation standardisation
Newsgroups: comp.sys.atari.programmer

If you read my previous post regarding SAM SAA files, you will notice that I was looking for a way to let an installation program automatically install the SAA files.

The same applies to various other items: an installation program should be able to automatically install desktop icons, automatically assign those icons to a file and also automatically associate document types with the application(s) being installed. Also, sometimes automatic installation of fonts would be desirable.

According to the style guide in the Atari Compendium, this should be done by directly changing the relevant files: newdesk.inf, desk[c]icon.rsc, assign.sys, extend.sys etc.

As you can see, however, the above method is far from satisfactory. In particular, I can see the following problems with the above system:

* The method for locating these files is undefined.

* Letting any application change these files could be dangerous.

* Some of the files, for example the desktop icon resource files, are rather difficult to modify from a programmer's point of view.

* But most importantly:
The TOS platform suffers from not having enough standards, and this is apparent here - when people use alternative desktops (e.g. Thing, Gemini, Neodesk, Ease...) and GDOSs (e.g. NVDI) that use different setup files to the standard ones, the above method will fail.

So, what is the correct method for installing items such as those listed above? It seems that there is no proper way, and if this is true, it is important that a standard method be put in place. Support for this method could then be added to desktops, GDOSs and other relevant software, and maybe we would finally be able to have user friendly installation software.

Briefly, I would suggest that such a method would include at least the following facilities:

* Facility for an application to add fonts to the system.

* Facility for an application to add icons images to the system.

* Facility for an application to assign icons to files.

* Facility for an application to assign certain file masks to an application, so that when the user double clicks on files that fit the mask, that application is started.

* The above facilities would have to be flexible enough that they could be supported by a wide variety of desktops, GDOSs or other system software.

* They should operate automatically, without the user having to carry out any of the tasks. Some user interaction may be advisable in places.

I would be interested to hear other peoples' views on the above matters.

This sounds quite interesting, though personally, I dislike having too many things done automatically - there's always some risk with it, especially if you are running your very own setup (e.g., under MS-DOS, my autoexec.bat always gets corrupted by programs which try to install themselves in it, as I'm using a multi-setup-autoexec).

Dispite my personal opinion, the above things could maybe be done with either an accessory, providing support for the user's setup (desktop, GDOS, etc.), or a system tool, which does the same. The system tool would have the advantage that it could be made modular, so the user just has to choose the module(s) neccessary for his setup. An environment variable could point to the full path of the tool, and another to the module directory (if desired).

The tool would be called with special command line parameters, telling it what's to be done (an accessory would receive AES messages for this). The exit code would signal success or failure of the procedure.

Is that what you are thinking of?

Ciao

Thomas

Greetings all!

I've put a mailto form in my webpage that generates an email to me.

I've done it this way because my server doesn't want to expend processor time on me processing the usual formto file.

He says I have to write a small program to strip out the garbage characters and put in carriage returns.

Is there such a little program out there? Anyone willing to write one for me in, say GFA Basic and provide me with source? I can email a sample message generated by the form if anyone is interested.

Thanks for the help!

Here is the short and SLOW source code for GFA-basic how to do that zoom and rotate effect with code.. I hope someone has help with it..

It does not have double screen buffer, because I can't remember the registers etc. it needs and I don't guarantee that it works correctly straight from this code.. But there it is anyway..

: the advantage that it could be made modular, so the user just has to choose
: the module(s) neccessary for his setup. An environment variable could point
: to the full path of the tool, and another to the module directory (if
: desired).

: The tool would be called with special command line parameters, telling it
: what's to be done (an accessory would receive AES messages for this). The
: exit code would signal success or failure of the procedure.

: Is that what you are thinking of?

Exactly. I wasn't sure exactly how it would be implemented, but that is
the idea.

I would suggest that the desk accessory would be less desirable since it
would just use up RAM, while most of the time it would lie unused. An
option where the program would be loaded only when used would be
preferable.

A possibility might be that the "installer" (I can't think of a better
name just now) would be programmable with some sort of script language.
The script would describe how to install various elements, and scripts
would be supplied with software such as desktops, AESs, GDOSs, SAM and
compatibles, etc.

The script might support features such as:

* modify a file in some way

* send an AES message to a running application

* permanently set an environment variable

* possibly some other similar methods

* ways of checking information before performing the above methods, such
as the ability to act on the contents of a file, environment variable or
other data would be provided

* possibly other relevant features

Such scripts could be installed to handle installation of any item, and all scripts capable of installing a similar item would have the same interface. This would mean that installation software supplied with applications would not have to worry about what method is in use, it could just use one standard method, and the script(s) would convert the request to system specific operations.

Naturally, the "installer" itself would come with installation software that is as universal as possible, so that installation of the "installer" itself would be easy to install. Also, software that needs to supply new scripts would be able to automatically install such scripts using a standard "install script" feature of the "installer."

So, the functions provided to installation software by the installer might include:

* "Install item"
Parameters would include:
+ type of item to install (possibly a cookie?)
+ path to item(s) being installed OR the actual data to be installed
+ how to install them (can't quite think how this would be used at present)
+ some type specific parameters

* "Uninstall item"
Parameters could be similar to "install item". It could be argued that this function would be best left out, but provided uninstallation software that uses it properly (i.e. the choice of what to do is ALWAYS up to the user, although a sensible default is provided) it should not be a problem.

* "Add or modify script"
This would allow a new script to be installed. Problems could occur if two scripts became available for installing the same type of item. I guess the new script would take precedence over the old script, but the old script would not be deleted. This way, if the user later un-installs the software that installed the new script, the old script could be reverted to.

Data types supported would be expandible, but in order to maintain compatibility and consistency, not just anyone could add a new data type.

Possible data types could include:

* fonts
* desktop icons
* icon-file associations
* file-application associations
* dlls, once they are supported (several such extensions to support dlls are in developmend)
* sounds, SAM SAA files, and SAM event-sound associations
* probably others.

Standard scripts could be made to support common programs, and hopefully programmers would catch on and start supplying the necessary scripts with their software.

It is important that an open, expandable standard for all of the above be developed, otherwise we will only be creating more non-standardness.

If enough people are interested, maybe we should set up a mailing list for discussion of the idea.

Is there anyplace to obtain include files with all the up to date #define's for the Falcon, MultiTos/MiNT and the AES? The Developer's Resource I have from Atari is April '93 and it mentions all the new window messages etc but doesn't provide the #defines. Thanks.

Newsgroups: comp.sys.atari.programmer

Mailloop v3.0 is an industrial strength bulk mailer.

Mailloop v3.0 is a bulk mailing program for the internet. It can take a single message and
broadcast it to either a listing of e-mail addresses or to a listing of newsgroups.
Creates custom newsgroup lists by filtering NNTP servers. Creates custom e-mail lists by
extracting them from newsgroups. Can also extract e-mail addresses or newsgroup names from
other protocols. Built-in NNTP, SMTP, POP, FTP, HTTP, EXEC, CGI, WHOIS and FINGER clients.

Anti-cancelbot feature. Automatically processes remove requests. Includes extensive on-line help.
The most powerful bulk mailer available. Requires Windows 95 or NT 3.51+ and internet access.

The "Program" Mailloop is only available in English.

For more info goto: http://205.199.4.219

http://205.199.4.219

Using it is easy:

1) Create a message (http://205.199.4.219/editor.htm)
...by using the pull down menus or
...by using any editor

2) Create a newsgroups list (http://205.199.4.219/news3.htm)
...by filtering an NNTP server or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from any FTP file or
...by extracting from any HTTP file

3) Create an e-mail list (http://205.199.4.219/em3.htm)
...by extracting from newsgroups or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from a WHOIS response or
...by extracting from a fingering response or
...by extracting from a UNIX response or
...by extracting from any FTP file or
...by extracting from any HTTP file or

4) Broadcast the message
...to the e-mail list or (http://205.199.4.219/embc.htm)
...to the newsgroup list (http://205.199.4.219/ngbc.htm)

5) Then process the remove requests
...by using the mailbox processor (http://205.199.4.219/pop.htm)

6) If you want you can use the Newsletter Sever
...The Newsletter Sever will allow you to have an topic-specific newsletter that other can subscribe
   and unsubscribe to.
...Customizing this server response files (http://205.199.4.219/response.htm)
...Creating a new newsletter (http://205.199.4.219/create.htm)
...Creating and Updating a newsletter the actual newsletter (http://205.199.4.219/update.htm)

Hi All,

I do not want to succumb to the hype generated by Java, but is there anybody trying to port the Java Virtual Machine on Atari Computers?

I believe the specification for network computer are high, in terms of memory, display and CPU, but the Falcon, and TT could be capable enough (Hades and Medusa for sure). It could be well worth it as such project could prolonge the life of our favourite machines.

What do you think?

Bruno

Start it, if you have the time. May be you could do a JIT Compiler...

Information about the virtual machine should be found at

http://www.javasoft.com/

For the interpreting the Java Bytecode bison should be the right tool.
just go ahead.

I thought I'd put BubbleGem support into some of my programs and have hit the following problem:

How do I check for either the left or right mouse button.
I have a main loop which uses evnt_multi (so I can process other events too). Part of the event_multi uses evnt_button stuff, but evnt_button seems to be a bit flawed. It seems there is no way to get it to return if *either* button is pressed. Just both (which is no use at all).

One way is to check on an evnt_timer using graf_mkstate but this seems very wasteful of processor time.

Is there a better way of doing this?

TIA, Gary

Hi, Gary
I checked my Lattice C manual.
You should pass a variable with the following bits set:

```
check for right mouse button: 1
check for right mouse button: 2
check for 'ALT' button:       4
check for 'CONTROL' button:   8
```

'OR' the values together that correspond to the event you're interesed of.

I've scanned mouse events with luck.
It should work.

Good luck!

Newsgroups: comp.sys.atari.programmer

Win '95 OSR-2.1 on CD with Fat32 Boot Floppy, FAT to FAT32
converter; $35 + 4.50 for Postage/COD, or offer.

Full install version. USB Support. This CD also contains
the Microsoft FAT to Fat32 converter.

Are you tired of losing up to 40% of your disk capacity
to the huge cluster size of FAT16, P-n-Pray that does
not work, poor pcmcia support, misidentified motherboard
resources, CPUs, ect?

Well, moving to the OSR 2.1 version of Windows '95 is the
answer.

Win '95 OSR2 also contains important patches, an expanded
(and debuged) drver library, PnP that works, GUI improvements
and bug fixes.

Yes - Some, not all, of these are available for as downloads.
Yet - The most important parts: *FAT 32*, the Kernel and GUI
enhancements, PnP improvements and proper CPU identifier codes
are NOT available for download and currently can only be
obtained with the purchase of a new computer or "memphis"
(Win'97), whenever that will be available.

The CD is the full install version. Included is a OEM cd-key,
an OSR2 boot floppy for creating a new FAT32 partition, MS CVT.EXE
for converting a FAT partition to FAT 32 detailed installation
instructions. In addition to these instructions, there is full
documentation on the CD. There is no "paper manual." Except
detailed installation information. Your current Win '95 manuals
will still apply, with a few *highly documented* exceptions.

The primary reason for migrating to OSR2 is, of course, FAT32,
which increases the storage capacity of your drive simply
by keeping the cluster size at 4K, despite the size of your
hard drive. It also recognizes partitions larger than 2.1g,
the current Win '95 limit.

I was hoping to get $ 35 for the CD, Boot Disk and instructions,
+ 4.95 for USPS COD. I am, however, open to reasonable offers.
I will pay shipping on pre-paid orders.
E-mail for more information.
Jason

This isn't what Gary was thinking of, as I understand it.

To check for either button is unfortunetely an undocumented feature, but
what you need to do is OR the mouse wait value with 0x100, that's
hexadecimal. To check if either is pressed, use the value 0x103.

Greetings,

Tomas

Depends whether there are enough Atarians out there who want to take advantage of network applications using JAVA.

My opinion on NC's is mixed, right now there's a lot of talk, promised product, demo machines, and assurances of actual consumer demand, which sounds a hec of a lot like Atari's ol' tricks. :-) I think a lot of people who could afford personal computers went out and bought those, and aren't likely to fork over more cash to buy a consumer electronic product that allows them to only link to the internet.

Also Bill Gates is putting pressure on the industry to stay away from NC's, and is also pushing VB Script and ActiveX. I guess this just encourages the split between C++ and Visual BASIC developers (only now on the network).

The Falcon and TT could likely handle it, but how many people who own Atari computers own these particular ones? I doubt most Atarians will rush out to buy a Hades just to use JAVA.

Still it does sound like an interesting development project. Maybe you should contact Sun Microsystems with a proposal to deliver a JVM for the Atari line. The fact that Sun has a distaste for Microsoft might get them interested. Anything to spread the popularity of JAVA vs. ActiveX could be seen as a positive.

Later...

PHOTO PHOENIX INTERNATIONAL

We are an international New York based agency representing
amateur and professional photographers in the following areas: Galleries, Business and Organizations, Book Publishers, Paper Products, Consumer Publication, Newspapers & Newsletters Publication, Special Interest Publication, and Trade Publication.
We are seeking photographers who strive for excellence in the aesthetic/ creative and technological world of images, who have the talent to capture the setting and to convey the mood. Your work should reflect a genuine, pervasive interest in photography as a fine art.
Whether your work portrays conservative, experimental, stylish, or innovative themes, your project proposal should be well thought out before submitting to us.
For first contact, please submit a query letter, direct mail flier/brochure, tearsheets, slides, photographs & SASE.
For amateur photographers, send sample photos and/or slides.
TO ALL: Do not send entire portfolio unless we ask for it. If we are not interested,
you might not hear from us, so please submit material that does not need to be returned.

Send to:

 Its a big suprise, quite a bit of rethinking to do :), I seriously
thought just a few thousand bytes for some sort of HD driver... well I
have to keep on the safe side so will make it a maximum 3.5meg,
 And thanks there mate... suprisingly none responsive audience for
this one.. perhaps the question was far too difficult ;--))

: button is pressed. Just both (which is no use at all).

: One way is to check on an evnt_timer using graf_mkstate but this seems very
: wasteful of processor time.

: Is there a better way of doing this?

Certainly there is. Unfortunately, the method for doing so is frequently
mis-documented or not documented at all. Nevertheless, I believe the
following is correct:

The first two parameters of evnt_button (and the corresponding ones of
evnt_multi) I will call clicks and mask respectively, as they are called
in the Atari Compendium.

mask should be set to 0x03 (both left and right buttons) and to specify
waiting for one OR the other you must OR 0x100 with clicks.

So, to wait for a single or double click of the left or right mouse
button for example, clicks would equal 0x102 (0x02 | 0x100) and mask would
be 0x03.

Note that this method only works as of TOS 1.02.

Actually, you should have substantially more than that unless the user has
large caches. I would have suggested 3.5MB or more.

The best way to do it would be to load more sounds, animations or other
data if memory permits, otherwise just load data when it is required.

 Yeagh but one way of looking at that is the HD user gets a more
crippled copy than a floppy user.. of course you could say HD game...
but Floppy users get extra :)

 One of the targets is to make a game that works exactly the same on
all machine, from a 4megSte floppy system to a 14meg Falcon with HD,

 Making it work differently for different versions means I dont get to
see whats happening, when someone writes to me about the software, I
like to be able to see exactly what they can see,IYKWIM :)

I think dropping my original 4meg target to 3.5meg wills ee me
through <Smile>

Thanks for the help. This is exactly what I wanted. I wanted to check for
either button. I didn't know about the 0x100 thing, but now I've tried it
it works great!! :)

Cheers, Gary

Talk about delayed response <g>!

The problem with EVNT_MULTI() is that, as I understand, it doesn't return until something happens. I needed continuous information as to the location of the mouse.

Anyway, problem solved--for me. I'm just using GFA BASIC's own MOUSEX and MOUSEY calls, which probably use Line-A routines. Yes, I know that's not the cool thing to do. I'll be able to check my program on a Falcon to see if there are problems. Of course, I pprobably won't be able to do anything about it if there are!

Have you looked? What kind of stuff do you want? I've written some apps for dealing with MY gear and software: An Akai S900 program editor, Korg M3R "combi consolidator" and "combi copier", a program to translate 9-pin printer dumps from Dr T's COPYIST (notation) program into graphic files and edit them, another to create/edit Copyist user symbols, a small utility to send big sysex files, and a few others I've forgotten about. I'm now working on a program for my latest synth, a Roland XP-50.

> Is there anything else you want to tell me about MIDI programming?

Not at the moment.

> Which language should I use...C...?

Which language do you use now? I use GFA BASIC which works quite well. I would imagine that there are C libraries that can do it just as well.

Just set EVNT_MULTI to wait for timer events and set the timer to a very
short value. The mouse coordinates will always have the current values,
no matter what event triggered the exit from EVNT_MULTI...

You can get a TIMER message to solve this.
Set the TIMER event to for example 15 (15 ms)
then when you recieve the timer message you also
get the mouse position and state.

Hi,
In assembly language I need to be able to find out both the total amount
of free memory, and the size of the largest free block.
I know I can use malloc with a size of -1, but which of the two sizes does
it return, and how can I find out the other.

Sam Ellis.

The GEMDOS Malloc() call (not to be confused with the malloc() call that is part of most C libraries) returns the size of the largest block when passed a value of -1L.

There is no "good" way to find out the total amount of free RAM, other than to Malloc(Malloc(-1L)) repeatedly until you run out of memory. Oh, and don't forget to free these blocks up afterward, preferably in the reverse of the order you allocated them. I use a linked list to do this.

Hi People,
Forgive the no-nothing nature of this posting, but.....
I find myself in need of a rather wierd utility that doesn't yet exist, so have decided I'll have to program it myself. Unfortunately what I know about programming could be written in large type on a postcard <g>
I'm using Hisoft Basic to do this, although I guess I could use Personal Pascal or Hisoft C if needed as I think I have both of them somewhere in my disc collection.

The problem is I've got an ASCII file that represents half wave-cycles of eight-bit audio, I want to teurn them into full-wave cycles, by splitting them up and inserting extra half-waves of a repeated but inverted type. ie I need to load each separate half-wave, invert each byte by taking it away from 255 and then stitching the two half-waves together. Each half wave is 64 bytes long, and is in a raw ASCII file. The whole file is 8K long, and has 128 separate half-waves in it. If stitching it together to make the final file is too hard, I could live with having a file of just the inverted data, although I'd rather not. I'm a bit stuck as the file is not comma-delimited in the way that would be normal for the old Basic DATA statement.
The process that has me stuck is loading an individual byte from an undelimited file, proccessing it is OK, I can use the ASC and CHR$ things, but stitching the two sub-files together onto the end of the final file is beyond me too at this point.

Unfortunately the Hisoft Manual (Another reason for using Basic is I have a real manual, the others are cover-disc give-aways) goes straight from a really simple <For a = 1 to 10>, <Print a> kind of thing into something about the Towers of Hanoi game (rings on poles)
I've thought of several ways of doing the load, if there was some way of erasing the first character in the file then I could cut each one off after processing and ASC would get me the value of the first character. I could then use that to generate each 64-byte chunk of the half wave, but I'd need some sort of sequential file-writer to do it with, use CHR$ and a similar sequential technique to generate the inverted side of the wave, then stitch each half wave together in order, as a final file...
I don't need graphics, this is a one shot to convert one file, but parts of it might come in handy again. In case you're wondering the files are wavetables from an old synthesiser that used these half-waves as raw sounds, in order to access the sounds we'd like to have full waves as it makes the decoding easier with normal electronics.
Many thanks in advance for any help you can provide, please reply via email rather than the group, I guess very few others will be interested in watching my faltering steps being corrected <g> also, my news access can be a bit flaky at times, zetnet frequently seem to run several days adrift...

sounds like a job for perl :) Is their a version of Perl for TOS?
how usable is it? If you can't get it for the Atari, do it on a unix
box. mucho easier.

btw- why exacly do you need full waves cycles? Was the positive or
negative polarity clipped from the recording? You might have trouble
reproducing the original waveform.

Does anyone have a list of Atari BBS's?

If you do, please post them.

Thanks, Erik and Vegard, for suggesting the use of a timer to exit the EVNT_MULTI() call. I'll give it a try but I'm not too optimistic. The function I used at one point (I forget if it was AES or VDI) was too slow for me--the mouse pointer flickered badly. The GFA MOUSEX and MOUSEY calls are much, much faster--probably because they directly access Line-A.

Malloc(-1) returns the size of the largest free block. To get the total amount of free RAM, one must loop over all the remaining free blocks. The C code for this would be

```
long free_ram(void) {
    long size,total,last;
    long *p;

    last = total = 0L;
    while((size = Malloc(-1)) >= 4) {
         total += size;
         p = Malloc(size);
         if(!p) break;  /* this should never happen! */
         *p = last;
         last = (long) p;
     }
    while(last) {
         p = (long*) last;
         last = *p;
         Mfree(p);
     }
    return(total);
 }
```

If you can't read C, I could translate this into assembly (but don't particularly want to).

For 4 color and 16 color modes you can create a lookup table using
the published values. For 256 color mode, the best method is to
draw all 256 colors to the screen using color indexes then examine
the resulting bit maps values using v_get_pixel().

yes, I have version 4 running Relational Data Base scripts, and I believe
version 5 is also available. But an even simpler approach would be to use awk.

>any more I can freely use without saving"?

Well, I think that, in the various messages that Thomas and I posted, you have
got a clear picture now, Gaven.
However, there is still a point that I would like to precise.

The FACT is that (X)BIOS and GEMDOS calls may destroy D0-D2/A0-A2. Now, how

to behave knowing that depends on what you want to do:
(1) If you want to write your own stand-alone assembly code making (X)BIOS calls, it is up to you to keep valuable data in any of D0-D2/A0-A2, and to save them when making the (X)BIOS calls.
(2) If your assembly code is one piece of a larger program, in C, say, then you must conform to the PROGRAMMING MODEL of your compiler. In Lattice C, for example, only D0-D1/A0-A1 are allowed to be destroyed by a routine. In this case, your assembly code must save D2/A2 upon entry and restore them upon return, IF your code
makes any (X)BIOS/GEMDOS call, that is, even if you don't play with these registers
yourself. Failure to do this systematically may lead to a crash of the routine which
called yours.

Cheers.

Roland (prajoux@laas.fr)

No real need to, but if you do, you will see that in 256 colour mode, the first 16 colours are ordered the same way as in 16 colour mode, and the other 240 colours are in the same order in VDI as in the Shifter.

Note that

a) Malloc(Malloc(-1L)) may fail in multitasking environments

and

b) it's a good idea to call such a function via Supexec(), as both MiNT
   and MagiC disable taskswitching in supervisor mode, so a) won't
   happen. Of course, this may not hold true for future versions of other
   multitasking environments.

Ciao

May I ask what you want to do? I wrote a little accessory some time ago
which writes the current mouse position into a window frequently. To
avoid flickering of the mouse pointer for such things, it's a good idea
to check if the mouse pointer is inside the rectangle which is affected
by the drawing before switching it off (of course, add some buffer area
around the rectangle). If it's an AES call, though, you can't influence
if it hides the mouse or not.

Ciao

Under MiNT it's also possible to find out the total amount of free
memory directly, by doing a Dfree() call on U:\PROC (i.e. have your
program change directory to U:\PROC and then do a Dfree() on drive
U:). This has the advantages of being an atomic operation, of not
shutting out multitasking, and not requiring the management of the
list of free blocks; but the disadvantage of not working under ordinary

TOS. (I'm not sure if MagiC supports this or not.)

This post is for Gaven (since his mail adr bounce) but also for
everybody interested in Fenix. Please let Gaven know of this post.

As you might know I'm writing Fenix which is a complete rewrite of
TOS/MiNT. Fenix has a scheme for shared libs similar to the Toolbox.
Since I think there is no need for two different library systems I
think we should discuss a cooperation.

I present here my two most recent software which I hope they interest you.
they are progammed by Turbo C++ and run under Windows(3.11 and 95).
here is a short description of these two software.

1-Robot Spy 1.0
at my knowledge, this software is the first and the unique of its kind.
This software allow you to spy your friends who are on the net at the same time
of you, it permits to see exactly what they do on their screen, pixel by pixel,
anywhere, in the world, at the condition they are connected to the internet.
how does-it work?
it's simple, you send a file to the person you want to spy telling to him it's a
game or everythings else, the objectif is this person run the file. from this
time,
a batch file is installed on his computor, and everytime this person use internet,
this batch connects him secretly on our server.
on your side, you , after the installation of the other part of the software every
time
you want, you can connect on our server with your password and have the list of
all the
persons who received your batch and who are connected at this time.
the only thing you have to do is to click on the name of the person you want to

spy.
a window opens containing exactly the screen of the person spied, you can have ten pictures per second with 256 colors, if you switch to balck and white mode you can
onbtain a real time sequence, approximatly 30 pictures by second.

Robot Mailer 1.1
The message you are reading presently is sent to more then 20,000 newsgroups with this software. This program automates FreeAgent, and reach with a connection of 28,8 Kbauds
5,000 news per hours. It can also find a maximum of 50,000 e-mail adresses from internet and
send a message in 4 or 5 hours. You can obtain with this sofware the most powerful tool of
mass transmittion on the internet.

Robot Spy 1.0.....20 US$
Robot Mailer 1.1.....20 US$
Both.....30 US$

I□m sorry i can□t accept credit card, but you can send an international money order to:

Ben Hedi Nassef
1481 Ste-Catherine est #7
Montreal, PQ, H2L-2H9
Canada

Don□t forget to include your e-mail on a paper, you receice the software ordered in your
e-mail the day we receive the money order.

Hi All,

Are you fed up with Falcon 030 owners showing off
their real-time audio effects program?

Well simply pop over to my web site, where you can down load
a rather smart bit of software (Programmed by me, no less), which turns
your bog standard ST/F/M/FM/E into a real time echo effects unit...

http://www.cee.hw.ac.uk/~ceebti/echo.zip

Download and Enjoy

N.B. Requires a master sound II cartridge for audio input...

I would like to start by apologising to anyone who feels that this
posting is not relevant to them. It has been sent to all newsgroups
where those involved with either art, programming or production may
read.

Before you think it does not apply to you, please read on....

Pelican Consultants are currently working with developers and
publishers of interactive entertainment. Our clients are based in the
UK and USA and we are currently looking to recruit people who are
regarded as being at the top of their profession.

Here is an example of who we are looking for:

Programmers with Artificial Intelligence experience - UK
Internal Development Manager - London and North UK
Head of Game Development - US - West and East Coast
Producers - North UK, London
Playstation Programmers - UK and US
Windows 95 Programmers with C and C++ - USA
Designers - UK
Storyboard Artists - London
Console Developers - USA and North UK

Graduate Programmers - London
3D Artists - London, North UK, USA
2D Artists - London, West UK
Head of Studio - UK

This represents only a small selection of positions on offer, and there are many more which we would like to discuss. Salaries range from £15,000 Sterling to $200,000 US.

These positions are genuine - we do not advertise fictional positions to attract business. Many of our clients have retained our services exclusively to identify these people.

We can guarantee that your interest will be met with discretion and that we wil take the time to discuss exactly what it is you want for your career. Our candidates are not placed on the 'open job market' but are regularly advised of opportunities which may suit them.

For an initial discussion, please call our Development Consultant - Paul Rose on (+44) 181 423 3400.

You can also email your resume to pjrose@pelican-consultants.co.uk or fax him on (+44) 181 423 1117.

We look forward to hearing from you soon.

In my program, there are 4 lists of 12-character names displayed in four
boxes on the screen. There are a total of 320 names displayed (I use ST-
high rez with 4-pixel-high letters). I "select" these names by left-clicking
and dragging the mouse over them. When the left button is down, I need
the x and y coordinates so I can figure out which name is clicked on. Using
any call other than the GFA MOUSEX and MOUSEY, the mouse flickered
badly while it was held down.

Actually, it's been so long that I forgot if one of those calls (AES or
VDI) *did* work OK (no flickering), except that the mouse position could
not be read when the mouse was in the upper 19 pixels of the screen--this is
normally the area for the menu bar, except my program has NO menu bar--I
need the *entire* screen to display all 320 names! I think that was the
problem that forced me to go back to using the GFA (Line-A) calls.

I cannot believe it !
I must work hard and pay lots of money for cubase software and you will get
a illegal copy - or what ?
Forget it - buy your stuff and stop beeing an unsocial guy. The fact is:
the more illegal copies where in use, the higher the prices for legal
customers. Fuck Piracy !
Hope, you understand my very poor english (8-|)

For my PCs I have accquired an Iomgea ZIP paralell port drive.
Now I would like to connect the drive to my Atari Falcon 030.
Does anybody know where I can get the necessary software, driver and
tools?
I am using the original TOS GEM delivered with the falcon.

> [...]

Mhmm, why not use wind_update(BEG_MCTRL) before starting the drag operation and call wind_update(END_MCTRL) afterwards? This would allow you to use mouse rectangle events that only occur if the mouse has really been moved. In that case, you can use a faster AES call and still receive the coordinates, so you'll still be able to react on mouse movement. But when the mouse is still, nothing will happen, so it won't flicker. Of course, if you need to draw something even when the mouse is still, this is not practicable for you.

But in that case, evnt_multi() with 1ms timer events should be OK, as this call also does not make the mouse disappear. It will only disappear if you call some AES function like objc_draw(), which have to ensure that they don't overwrite the mouse cursor. Also, no VDI drawing primitve cares for the mouse pointer (that's why you have to switch it off with graf_mouse() yourself before drawing to the screen), so you probably used some AES call to draw stuff.

Ciao

Thomas

Even though that's a FAQ: It is not possible to use a parallel port Zip on any Atari, as the Atari's parallel interface lacks some signals necessary for that. But even if it provided them, I don't think there would be the software you need for it, as Iomega wouldn't give details on how it works (not regarding that the speed wouldn't be too useable).

So, if you want to use a Zip on the Falcon, get the SCSI version (internal or external). Also, if you want to use the special features of the Zip drive, like password protection, get HDDriver, which currently is the only harddisk driver that can do this (a demo version is available from ftp://acp5.chemie.uni-kl.de/pub/atari/).

Note that you need a special adaptor to connect the external SCSI Zip to Ataris, as it only ships with a Mac SCSI cable. Also note that the internal version comes with a PC ISA hostadaptor and a tool disk for Mac/PC, which both are of no use for the Atari. So you might consider getting the "bulk" version.

Ciao

Thomas,

Thanks for these suggestions. Remember, though, I'm a GFA-BASIC person
<g>! A lot of what you said is not clear to me yet. I have the Atari
Compendium, so hopefully I'll have a better understanding after doing
some reading.

Robert

Hello,

Roni Music Home Page offers free down load of the Sweet Sixteen MIDI
Sequencer for Atari computers.

Sweet Sixteen is a comprehensive and powerful MIDI sequencer for
PC/Windows and
Atari ST/STE range of computers.
Sweet Sixteen offers Piano Roll, List and Transform edit pages as well
as a
dedicated Mixer page you can use for your favourite synthesizer.

Three versions are available:
1. A shareware version which is a complete version of Sweet Sixteen
which you may try out for 30 days.
2. A demo version which is a complete version of Sweet Sixteen with all
file saving disabled.
3. A "lite" version which lets the user save files but certain other
functions are disabled.

Check it out at: http://home1.swipnet.se/~w-11396

Sweet Sixteen is $ 29.95 US

Forget it! No tools avaiable.
For atari machines only scsi zip devices.
No paralell drivers avaiable..

(HDDriver 6.2x for scsi versions)

Regards, Robert

I did download the lite version, but it looked to me like it was crippled
with annoying shareware messages, which makes it as much a shareware version
as the
other one.

Nice program though..

1) A temporary copy is made of the SR.
2) The processor enters supervisor mode (changing the bit in the SR).
3) The PC is saved on the supervisor stack.
4) The copy of the previous SR is saved on the supervisor stack.
5) The vector is fetched from the appropriate place in memory.
6) The Program Counter is set to the contents of the vector.
7) Execution continues from the address in the PC.

All other registers remain unchanged (including the CCR), so it is up to the
trap handler to save and restore them as necessary.
Also, if I remember correctly, the trace flag in the SR is cleared during
the transition to supervisor mode.

Hello folks!
I'm trying to code basic I/O routs via // Ports (Byte and memory bloc
transmit/receive) and I thought they should be more easily callable
installed as a TRAP #something...
And what about a Linux PPP ST to ST transmission at 20 Kb/s???

So,the question (tres importante):
what's EXACTLY happens when a TRAP is called (supervisor mode, changed
registers, CCR and SR flags, etc...)

Yes! yes! YeS!
Better leave some bandwidth for F030-Iphone. I really want
this programm. Few others people too... Please help if you can !!!

Andy

:
: Sorry , no.
: It is documented that D0-D2/A0-A2 can be corrupted by a BIOS/XBIOS call.

Roland, please read through the text again. He was asking what register
he was free to use without saving them when replacing a XBIOS call, and
as some OS XBIOS calls also uses D2 and A2 besides D0-D1/A0-A1 he should
be free to use them as well. That's what I was telling him...

Take care,
Daniel

Can someone help? I have found a very useful looking program/source for a font selector that I can use to advantage in TelVT102.
The source is there as is a .rsc file. It also has a .rso file which I presume is some sort of equivalent to .hrd, .rsd, dfn. or .def.
I have written TelVT102 with Lattice C 5.6. I need to edit the font selector box in the .rsc file.
I have tried to do it by hand, using wconvert, rs2l, rsconv, etc. Nothing seems to work. Does anyone have any idea what an .rso file belongs with, and/or how to convert it to WERCS. I do have the wconvert program, but that will only cpnvert from a .def, .rsd, or .dfn file.
I tried loading it with WERCS, and renaming everything by hand according to the names of the items in the program, and it compiles, but bombs with a bus error when I try to run it. Clearly something is missing.

HEEEEELP!

Boris

Re: ATARI 1040 ST-fm First Word Plus Help Request

Dear Atari Folks,

I'm trying to help an older gentleman who invested in an
Atari machine for word processing many years ago.

I need your help to find information about how to "export"
several large, important documents from First Word Plus (the
word processor) on the

Atari 1040 ST - fm (platform)

to any DOS or Windows MS Word, Wordperfect or ASCII format.

If you cannot advise, I may have to *print* the documents
and then scan them with OCR! I'm hoping you may have a
better, more straightforward solution?? Please?

Thank you, in advance, for any advice you may supply.

Pax,

I'd really like to see one of these babys too!
Perhaps there's source avilable to a unix flavored version that can
be ported to run on a Falcon? One thing that concerns me however...
I once read that 030 Macs couldn't do Internet phones cause the processor
wan't fast enough (most likely a bull excuse), which might mean a special
DSP/CPU married version must be coded from the ground up.

Personaly, it seems to me that an 8bit half duplex version should be
possible on STe machines as well...so long as you plug in a Replay, or
similar cart to the ROM port. Maybe even a 16 bit version for the Replay
16?

Real Audio would be really cool too!

Brian

The *.RSO file is a native definition file for ORCS, the shareware RSC
editor. It can also write DEF files, IIRC. ORCS should be available from
any good Atari FTP server

One problem you maight run into, is that the DEF format only allows 8
char object names, while HRD and RSO allows more...

I think your problem is another one, though. If you get a bus error
after editing the RSC file, you have changed the structure of the RSC in
such a way that the program gets an adress error while dealing with the
RSC. However you name the objects is not going to change that...

Bye,
Vegard Hofsoy

Yep. Take a loot at sunsite.unc.edu (or one of it's mirrors) in
/pub/Linux/apps/sound/talk/
There should be a few sources in there.
Such a source would have to be rewritten to use the Falcon audio hardware,
though. (Except if it uses /dev/audio, which is also available for MiNT)
The programs probably work using MiNTNet and the portlib, but they could be
adaped for use with STiK too.

: One thing that concerns me however...
: I once read that 030 Macs couldn't do Internet phones cause the processor
: wan't fast enough (most likely a bull excuse), which might mean a special
: DSP/CPU married version must be coded from the ground up.

The compression routines usually need quite a lot of CPU power.
Some of the programs use GSM compression (sources freely available,
maybe even a DSP version somewhere?) or something of their own.
This part might have to be ported to the DSP to get enough speed...

: Personaly, it seems to me that an 8bit half duplex version should be
: possible on STe machines as well...so long as you plug in a Replay, or

: 16?

Even at 4 kHz 8-bit mono you'd still have to use some compression,
coz' even 28k8 modems can't handle 4 kb/second plus package overhead...
But this could probably be some fast lossy assembly code, so theoretically
it is possible...

Maybe, but I'd bet not more than 2 of these 9 use menu_popup(), but their
own routines, because the popus should work with older AESes as well.

Ciao

> So, registers D2 and A2 must be saved by your routine before a BIOS/XBIOS call.
The same applies to GEMDOS-calls, though it's wise to save a2 inside routines
hooked into GEMDOS or (X)BIOS, as some buggy software relies on a2 not being
altered (which is true for most original GEMDOS-calls, but not documented).
An example is Pure C, which can't access its help files anymore if a2 is
altered during a GEMDOS call ...

> Another problem bites the dust!
What I wanted to say with "may or may not work" was, that Dopendir() _will_
work with certain CD-ROM drivers, so it may be a workaround for your problem,
but it's not a real method to detect a CD-ROM. Anyway, a crash due to calling
Dpathconf() is either a problem of the driver or the kernel and should be
checked. Do you have any more information about that crash?

I must admit that I first wanted to write the same, but then I read the original question again and got unsure. Gaven asked if more registers are deemed scratch and therefore have to be saved by his code (which apparently means the code calling his XBIOS-interface), so D2/A2 may be used freely inside an XBIOS routine and therefore have to be saved before calling the XBIOS from within an application.

Of course, Roland and I may have misunderstood Gaven's question, but to be honest I think it's a bit ambigous (which I hope my answer isn't) ;)

Make $50,000 in 4 weeks!

This system works! NOT A SCAM... Read the text!

This is the fairest, most honest way I have seen to share in the wealth of the world! This works so well that all of my friends are trying it!

Take five minutes to read this and it IT'LL change your life if you want to know how to make thousands of dollars quickly, and leagally with NO CATCH, then keep reading.

THe internet has grown tremendously. it doubles in size every 4 months.

Think about it. YOu see those "make money fast" postings more and more.

Thats becasue it works! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, whats $5 and a little effort on your behalf?? Everyone was calling it a scam, but there are soany new users from AOL, NETCOM, etc. that they will join in and make it work for you.

just follow these simple steps:

STEP ONE
Invest your $5 by writing your name and address on five seperate sheets of paper along wit the words: "PLEASE ADD ME TO YOUR MAILING LIST." (in this way you are not just sending a dollar bill to someone, you are paying for a legimate service.) Also on each of the sheets of paper indicate the number of the person. Fold a $1 bill inside each piece of paper with your name and address on it. Ensure that when the dollar is folded in between the paper and it is held up to light, THE DOLLAR SHOULD NOT BE VISABLE! Mail 5 of these letters to the following 5 addresses: (only U.S. Dollar bills should be used)

1) Odd Hilsen
Avda Espana 93
Sitio de Calahonda
Mijias Costa- Malaga SPAIN

2) Peter Kjoge
Camino de la Condesa 9, 5-A
E-29640 Fuengirola SPAIN

3) Bob Tomlinson
3208 21st
Sioux City, La 51105 USA

4) Alex Tikhanoff
1636 n. Verdugo rd.
Glendale Ca. 91208 apt.202
USA
5) hinda kolansky
49-35 167 st
flushing ny 11365 usa

STEP TWO
Now remove the top name from the list, and move the other names up. This way, #5 becomes #4 and so o. Put your name as the fifth one on the list.

STEP 3
Post the article to at least 250 newsgroups. There are at least 19000 newsgroups

at any given moment in time. Try posting to as many newsgroups as you can. Remember, the more newsgroups you post to, the greater your audience and cash flow from all these subscribers.

STEP 4
You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the internet is new and awesome in its size. There is no way you can lose.

now here is how and why the system works:

Out of every block of 250 posts i made, i got back 5 responses. YES! THATS RIGHT ONLY 5. You make $5 in cash, not check or money orders, but real cash with your name at #5.

Each additional person who sent you $1 now will also make 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1 with your name at #4....$50 in your pocket!

Now these 50 new people will make 250 postings each with your name at #3 or 10,000 postings. Average returns, 500 people=$500.00. they make 250 postings each with your name at #2=100,000 postings=5000 returns at $1 each=$5,000 in cash!! Finally, 5,000 people make 250 postings each with your name at #1 and you get a return of $50,000 before your name is dropped from the list. And thats only if everyone down the line makes 250 postings each! Your total income for this cycle is $50,000.00

When you see your name is no longer on the list, you take the latest posting and start all over again.

The end result depends largely on you. You must follow through and repost this article everywhere you can think of! The more postings you make, the more cash ends up in your mailbox. Its too easy and too cheap to pass up!!

So thats it. Pretty simple sounding working concept, dont you think?

But believe me, this really works. There are millions o people surfind the net every day, all day, all over the world. And 100,000 new subscribers everday eager to access your newsgroup. Youknow that because you have read the facts in the newspaper and seen for yourself on T.V. So, my dear little 'fortne seeker.' read carefully the instructions and play fair and swuare with your endeavors.. remember, YOU CAN ONLY TAKE OUT WHAT YOU PUT IN!! thats the key to success in any venture. Print these pages out now so that you may refer to this article at a later date. try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be!

REMEMBER....HONESTY IS THE BEST POLICY. YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE BIG BUCKS!! GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOUW ILL BE MORE THAN GENEROUSLY REWARDED!

P.S. if you try to decieve people by posting the messages with your name in the list and not sending the bucks to the people already included, you will not get much. I know someone who did this and only got about $150 (and thats after 2

months) then he sent the five bills and was added to their lists. In 4-5 weeks, he had in excess of $10,000.

Good luck!

CVTranslator(Carlos Varelas) is pretty good, but slow.
you can edit the dictionary, double clicking on the German word
brings up a dialog box where you can type in the english equivalent,
which is then saved in a dictionary to be used next time.

The simplest way is to turn OFF "WP Mode" in the Edit menu and then save as an ASCII file.

There are some utility programs which will convert Word+ files to Word and WordPerfect format preserving text effects. I hope others will give you the identities of these progs.

I have made a program that converts Wrodplus files into ASCII-format for use in for instance MS Word. There are several other programs out somewhere that does the same thing. If you can not find any program, please contact me and I will send you my program. If you have got access to Internet, I could send the file by E-mail or on my Website. Otherwise I can send a diskette.

Yours sincerely

E-Mail Your Way To Riches!

Dear Friend,

We all know E-mail is here to stay. It's fun, easy and exciting! Would you be interested if we could show you a way to make well over $1,000 per week doing it?

This is not a joke. You may have seen many people trying to tell you that you can make money by joining this or that scheme! Guess what, you decide to go for it and then you get nothing but frustration and disappointment! We are here to take your frustration and disappointment into an Electrifying Adventure!

We have been marketing on-line for almost 2 years now! We have never spent one red penny on advertising and made nothing but profits. We can show you how to make money every day of the year. Many people may think this is untrue or it just can't be done. We are here to tell you that it is absolutely not true. The
biggest mistake people make about marketing on-line is that they sit and wait for people to contact them. You will never make it if this is your approach and we'll tell you why. There are over 60 MILLION people on-line right now, and seven new people logging on every minute of the day world-wide and everyone is offering something. So how do you get a potential client or a new customer before your competition does? The answer is simply " Creative E-mailing" and it WORKS! I'll tell you why. You're taking your product, service or idea directly to the market instead of waiting for the market to come to you!

Here are a few testimonials we'd like to share with you (They're all 100% TRUE!):

Internet Communications, my wife and I owe you so much. We ordered your Creative E-mail System and within the first week we received over $1,150 in orders for my Internet Consulting business!
--Charles -- California

I have bought two so-called E-mail programs that cost me over $600.00 when I received them. They were extremely difficult to operate and it took me about two weeks to figure them out. Once I did, they were so time consuming it just wasn't worth my time. When I received your course it took me about four minutes to install and I was in business! Within the first 24 hours of my first E-mailing I received over $580.00 in sales over the phone. That first week I grossed over $2,000.00! I really can't believe how easy you made this, anyone can do it! Thanks!
--Dennis -- Illinios

Hello, I'm a divorced mother of two children. I wanted to thank you for helping me out. This was my first time buying anything on the Internet. I was skeptical at first but I figured I'd take a chance. This was the best chance I've ever took!

My part-time business is now a full-time home-business, thanks to your Creative E-mail System. I had to hire my two family members to help me out! This is GREAT, thanks so much! I'd recommend this for anyone!
--Ellen -- Florida

You may have seen other people offering products "E-mail Programs, E-mail Addresses, Extractors, Etc." The vast majority of these products are very over-priced and very difficult to even use. None of them even supply you with current, up-to-date, FRESH & RESPONSIVE E-mail addresses! Our Creative E-mail System puts everything into one package to make your profits soar immediately! Even if you do not have a product or service to offer, we are going to give you over 500 how-to reports that you will have full reprint rights to! What makes our course different from anything else being offered anywhere is that we're dedicated to your success! We do not succeed unless you succeed! All of our E-mail Address Databases are created in house. We do not trade our databases with anyone because people are selling extremely bad lists on the Internet. Many of other people's databases are filled with duplicate addresses and many of them are undeliverable. We keep our own database so we know exactly what we have and we keep nothing but the best. There's no other way. We believe in producing high quality products that should be priced reasonably for your success! Read on to see the special bonuses you will receive.

******** SPECIAL 10 DAY BONUS ********

If you order within the next 10 days we will include:

1) 500 How-To Reports (You may resell these at any price)

2) Your Personal Complete Guide To The Internet -- This 175 page e-book covers every single aspect of the internet. You will never have to buy another internet book! When you complete this book, you will know more about the internet than 90% of the people online right now.

3) When you purchase our 8 MILLION SUPER responsive E-mail list we will include Mega-Mailer. It sends 250,000 E-mails per hour! All other orders will receive Pegasus Mail. It mails about 30,000 per hour.

Here's how to get the Creative E-Mail System:

All orders are delivered on CD-ROM or 100mb Zip Disk (Iomega).

==========> E-Mail Databases <==========

2 Million FRESH E-mail Addresses only $ 99.95
4 Million FRESH E-mail Addresses only $179.95
6 Million FRESH E-mail Addresses only $249.95
8 Million FRESH E-mail Addresses only $299.95

You will be sending your Marketing Letter to 2, 4, 6 or 8 MILLION People! To mail to 2 MILLION People by U.S. Mail at $.32 per stamp would cost $640,000.00, not including envelopes or paper! The price of 2 MILLION E-mail Addresses isn't even a fraction of the cost. And the great thing is that if you

have 10 products, you can E-mail to your list as many times as you want to! Your profits will never stop soaring! Don't pay someone else to send your advertisement out, do it yourself and save big money! The average cost right now to send your ad one time to ONE MILLION people is $1,400.00. You can send it 100 times to EIGHT MILLION people for only $299.95 and that includes Mega-Mailer that sends 250,000 per hour!

==========> Order Form <==========

Is there an easy way to convert VDI palette index colors to Shifter colors (ie. the ones in the actal bitmap) and vice versa?
I need to do this for a collection of prlotting routines that I use in combination with the normal VDI routines (coz' as far as I know the VDI has

no fast plotting routine...)

Thanx...

Hello!

Another Idea:
Plot your points in memory bitmaps and then blit them with
vdi_copy_raster onto screen, perhaps line per line. Excellent for
rectangle areas.

I was a bit ambiguous. Sorry.

What I meant was : "A0-A1/D0-D1/FP0-FP1 are scratch registers, are there
any more I can freely use without saving"?

From the answers generated so far, I beleve that D2 and A2 are scratch
registers used within XBIOS/GEMDOS calls (and I presume, BIOS calls as
well).

(BTW: Full marks to you for correctly spelling my name. Most people
mis-spell it as "Gavin". You correctly spelled it as "Gaven")

>but it's not a real method to detect a CD-ROM.
Yes, understood. I wasn't wanting to detect a CDROM as such, but just stop my program from crashing when a Dpathconf() call failed. Checking the path exists with Dopendir() first seems to work... so far :-)

>Anyway, a crash due to calling Dpathconf() is either a problem of the driver
>or the kernel and should be checked.
I agree that a crash isn't a good way to go about failing the call :-)
The driver was ExtenDOS Pro.

>Do you have any more information about that crash?
No, other than a Magic '68000 exception error' whatever that is. From what I understand of that error message, it doesn't tell you much and often isn't related to the underlying problem.

Yeah, but I'd need something to plot them with, wouldn't I?
That's where my little routine comes in handy. There's just one problem: it writes directly into the bitmap, and as the shifter palette indices seem to differ from those used by the VDI, I'd need some way of converting them into eachother...

I seem to be coming up with a problem lately with editing my resources .
Everytime I edit my PAPYRUS RSC from french to english it comes back with this
is not the right resource message. Are they saying there using a Byte count ?
The same thing happens with Connect95 but in a different way . Here it does
work but the desktop boxes no longer are visible . What's going on here ? Any
help is appreciated .
Thanks in advance !

Subject: Re: Toolbox API: Detecting the Toolbox
Date: 1997/05/08
Message-ID: <587cd$1180.2f5@HERMES>#1/1
X-Deja-AN: 240143926
Newsgroups: comp.sys.atari.programmer

In order to detect the Toolbox, you will need to call the Toolbox ID
function via the XBIOS interface.

If the Toolbox does not exist, the XBIOS will return an error code equal

to the XBIOS function number.

If it does exist, it will return 'TLBX' in data register zero.

The XBIOS function number through which you communicate with the Toolbox is number $7462 ('tb' in ascii, or 29794 decimal).

To call the ID function within the Toolbox, you pass a 32 bit function number of zero as a parameter.

So, the entire detection code looks like this:

```
xtlbxID:
     clr.l     -(sp)         ; tlbxID()
     move.w    #'tb',-(sp)   ; XBIOS interface to TLBX
     trap #14       ; call XBIOS
     addq.w    #2+4,sp       ; clear stack
     cmp.l     #'TLBX',d0    ; does it exist?
     bne  not_exist ; nope, so do something else...
```

Previous versions of the Toolbox installed a 'TLBX' cookie in the cookie jar, but the "data" portion of the cookie was altered frequently, and should not be relied upon.

All Toolbox calls are normally via "TRAP #0", however, as some debuggers (like Hisoft's MON that accompanies Lattice C, Devpac, and Hisoft Basic) like to reprogram the Trap #0 vector to point to their own "invalid trap" handler, the ID function will also reprogram the vector to point to the correct place. This is why you should use the xtlbxID() function above to detect it. This function has recently been introduced as the only legal means of detecting the Toolbox.

If you own Lattice C, and wish to inline xtlbxID() in your apps, simply add the following lines to your TLBX.H file

```
     #include "0/types.h"

     uint32 _xtlbxID(uint16,uint32);
     uint32 _tlbxID(uint32);

     #define _XTLBX     {register d2,a2; "4e4e";}
     #define _TLBX { "70007210204022404e40";}

     #pragma inline d0=_xtlbxID((short),) _XTLBX
     #pragma inline d0=>tlbxID() _TLBX

     #define xtlbxID()  _xtlbxID('tb',0x000)
     #define tlbxID()   _tlbxID(0x000)
```

, and then you can just detect the Toolbox like this:

```
     #include "0/tlbx.h"
```

```
     int main( int argc, char *argv[] )
     {
          if( xtlbxID() != 'TLBX' )  {
               printf( "TLBX not available\n" );
               return errorNoToolbox;
          }

          ..
     }
```

I'll be uploading the Toolbox to an FTP site or perhaps an Atari binaries newsgroup shortly.

If you have any questions or comments, feel free to follow up the Toolbox API threads.

X-Deja-AN: 240157531
X-Everything: Shotgun v2.00
Newsgroups: comp.sys.atari.programmer

This archive was created to show you how the proprietary graphics protocol used by Shotgun BBS actually works. Yes people, the secret is out, no more trying to hide Shotgun's limitations, you can now see why there are no SVGA doors written for Shotgun. It is simply because of the lack of forethought and good planning by the author. Everything in this archive is written for Borland/Turbo Pascal v7.0

The BBSLIST.PAS is the main program source code for an example BBS listing door for Shotgun. Its simple, and shows you exactly what a person can actually do with SVGA doors and Shotgun. That is "Very Little", sad, but true. The chances of Shotgun's graphics protocol ever becoming adopted as a standard are slim to absolutely none.

The YAPPKIT.PAS is the unit file that shows how Shotgun BBS handles screens and parses keypresses. If you don't use Async Professional, you will no doubt have to make major modifications to this file!

To recompile the SG screens to GIP screens, use the -REALNAME switch at the end of the command line for PAKGIP.EXE or it won't work! You _can't_ just renmame the file!

Hello

I am starting up a company in the Netherlands. We are distributor for many products in Europe and outside. We are looking for companies who want to become reseller of some of our products in there country.

We have products for every branche in our assortiment. Just mail me and we can discuss this further.

We are also looking for programmers since we are developing software ourselves, If you can program good please contact me and we can discuss this.

Sincerely

Ruben Daniels

I need Software developers who can program highly advanced graphic programs.
 The Software needs to run on Unix Workstations and Windows NT/95 environment.

It is not a one person project. You will be working with multiple people.
So you have to know(or learn fast) how to work in a team.
It doesn't matter were you live. 'Cause we can have contact through the Internet.

If you think you can do this, PLease ReMail this message and tell me something about yourself and your work(not neccesary). And I will send you some more information.

Sincerely

Ruben Daniels

The CAD industry is a very delicate industry.
Everything has to be precies sometimes as precise as a 10th or 1/100 of a mm.
This is iin some case impossible to do with a computer cad program.

Companies that have these problems for instance people in the designing industry have to make everything perfect.
For them is it impossible and much to time costly to use a computer fo this purpose.

Well I have got the best thing for you.

It is an machine developed in Denmark.
There is still only one prototype of it.
It is a laser wich can scan any object and make it into a dxf format file.

Of course you can see that this machine has unlimited possiblities to use it.

We offer now, 'cause we still have to refine and test it, a free use of the machine.
The only thing you have to pay are the transportation of the object you want to scan to send to Denmark.

It has an accuracy of about 1/10 mm but if the machine is ajusted just right it cen be even more accurate.
In the future we expect it to be as accurate as 1/100 of a mm.

Of course the objects cannot be very large. If they are they must scanned in a couple of times.
Of course this is no problem.

It can save tens of thousands of dollars because else someone had to make it with the computer which is impossible to do with a precision of a 10th mm.

The speed of this machine is incredible of course you can control this but it can be done in 5 minutes. Of course the scan will be better if you let it take more time to scan.

Please remail this message for more information. Please tell me what kind of object you want to use it with etc. If you want to make use of the testing we will bring you in contact with the developer of the 3D laser.

When you remail lthis message please answer the following questions.

Thank you

- If this machine was brought to the market what would you be willing to pay for it?

$10.000 - $20.000
$20.000 - $30.000
$30.000 - $40.000
$40.000 - $50.000
Another value please type it yourself

- What would you use it for and what do you think it can be used for?

- Do you know people who could use this product? (Do you want us to contact them)

Sincerely

Ruben Daniels

Hi!

In article <587cd$83c.336@hermes>,
     gmiller@inca.co.nz (Gaven Miller) writes:
> What I meant was : "A0-A1/D0-D1/FP0-FP1 are scratch registers, are there
> any more I can freely use without saving"?
>
> From the answers generated so far, I beleve that D2 and A2 are scratch
> registers used within XBIOS/GEMDOS calls (and I presume, BIOS calls as
> well).
Yes, D2 and A2 may be used freely within (X)BIOS- and GEMDOS-calls, but
as I've already mentioned, it's wise to save at least A2 within GEMDOS
calls, as some older software relies on the (undocumented) behaviour of
all built-in GEMDOS-calls not altering A2.

IIRC, FPU registers aren't used in any operating systems calls and there
are no reliable docs whether you may use them or not. So, I'd assume
all FPU registers have to be preserved within an additional operating
system call. If you don't need them anyway, don't care about them.

> (BTW: Full marks to you for correctly spelling my name. Most people
> mis-spell it as "Gavin". You correctly spelled it as "Gaven")
Well, IMO it's not that hard to read and write names correctly, as long
as they're not too unusual, which I'd say Gaven isn't for sure ;)

Ciao

Thomas

Where can I find information about GEM functions.
(to be called from assembler by the trap #1 command.)

Thanks.

Hi, we'll get right to the point. We operate one of the finest
quality custom color labs in the USA. To introduce you to our
service we're offering the following Internet enlargement special:

Your color negatives hand printed on Kodak Supra Professional
16x20 inch paper. All negatives printed full frame.
Exhibition quality and color corrected---send us any size color
negative (35mm up to 4x5 inches).

* * * * * * * * * *
16 x 20 inch color enlargement special
  5 identical prints from same negative-------$79
10 identical prints from same negative------$129
* * * * * * * * * *

Most orders 1 to 2 days in the lab. Add $6 priority mail shipping;
international add $10. We accept Visa and Mastercharge.

Mail your negative(s) and payment to:

TSP CUSTOM LAB

Why not use EVNT_MULTI()? It should be able to give you mouse, keyboard
and message responds.

I just thought I'd let everyone know....

There is finally a BBS Software with all of the great features of OBV/2 and Iniquity, but without the bugs and bad
support. Infusion BBS Software is a new generation in BBS Software, modeled after OBV/2 and Iniquity with everything
that the sysop can imagine..and more.

Some basic features are:

o Multi-node upto 255 concurrent users
o Light-bar support [arrow keys]
o Requires NO Fossil Driver [selectable FOSSIL, ASYNC, and Digiboard for each node]
o Online Configuration [menu editor, string editor, evemt editor, node editor, system editor, etc]
o Pipe Color Codes
o MCI Codes
o Powerful scripting language
o Internal One-Liners, Blacklist, voting booth, etc
o Internal Z-Modem, X-Modem, Y-Modem, Y-modem-g [no limit to external protocols]
o Internal COMM Program with internal protocols, Auto Up/DL
o Great support
o Basically all of the great features of OBV/2 and Iniquity combined

Infusion has been picked up by fuEl [international art group], and Infusion 1.0th will be released June 10th.

Come to the Infusion Home-Page at http://web.wt.net/~sparky/ibbs/ and jump into the JAVA Based Chatroom,
or come to the ANNEX, the official Infusion IRC Server [irc.annex.net] #infusion / #bbs

send the author skaboy101 [Grant Passmore] E-mail at skaboy@usa.net

(I assume that this was a typo. _GEM_ is called via TRAP #2, whereas
GEMDOS is called via TRAP #1)

I use the Compendium book as a reference to the system calls I may use
once every three millennium. (However, I'd have liked it to be a lie-flat
[ring-bound] book. Admittedly that may be difficult with a book of 900-odd

pages)

You should never use the FPU inside the OS calls. There will be all kind of problems if you try to, eg., exceptions may only be reported at the next fpu insn, so you might get one from the last fpu insn executed in user mode. At least you should save and restore the *whole* fpu context (fsave/frestore + fmovem for all fpu registers) around any use of the fpu inside the OS call. Or better, don't use it at all.

load the binary file "CPU_MOD.BIN" into memory to the address that is
stored in the variable Cpu_Mod%
this simply loads the file into a 80k memory block that was reserved with DIM.
> call Cpu_Mod, ...
jsr›s to the cpu_mod routine. arguments are passed on stack as with C:()
so I would suppose
this would work with C if you would use it like a C subroutine.
W means argument has word size
L means argument has 32bit long size
If I remember correctly, the first four values are command,
(zero),mono/stereo, frequenzy (all word size),
then the address of the MOD in memory, and the length, both 32bit long size.
If it does not work, you might try to swap the order of the arguments
(means: last one first and so on).

Try this with VDI line thickness = 3 and arrowed end:
-Buffer the last 20 mouse positions
-clip mx-16,my-16,32,32
-restore background if possible
-save background
-draw a line from buffer_x[20],buffer_y[20] to mx,my
and then start over.

At least with NVDI, this looks very funny. And don⍰t forget to move your mouse:)
AND don⍰t do this in a GEM application!

Memory allocated by an accessory under standard tos does not belong to
the accessory - it belongs to the main application. The other problem
is afaik it has never been documented that an accessory can launch any
program. Only the main application can.

> mv *.c subdir/*.c
> and kiss your files goodbye.

First of all, I never did it (but it IS something a user might reasonably try). The version of UNIX it was done on used the form

```
 mv source dest source dest ...
```

There is no way to fix that; the shell doesn't know that mv is expecting a list of pathname pairs, and mv doesn't know that the shell expanded the wildcards into a list of pathnames.

I was't aware that mv had different definitions on different platforms (I guess that's why they call it a standard).

And yes, UNIX is a package INCLUDING everything in /bin. If all you bought was the shell and had to write your own /bin from scratch, you might actually come up with a reasonable command line driven OS (after a few years), but it wouldn't be UNIX. (It would probably still suffer from an obsession with device independent I/O, though.)

The main problem with UNIX is that the commands in /bin were written by many people (mostly grad students) with varying programming abilities, often working in isolation from each other. They don't always parse arguments the same, some are reliable and others very buggy, and the names are often deliberately obscure. For many years there was little effort made to clean up bad commands; one company reported the same bug (and how to fix it) in 3 different releases before they gave up.

As a programming environment, my main complaint was the sheer size of the function library (our documentation was contained in 7 volumes arranged alphabetically, including a 1 volume index, not including X-Windows). There may have been lots of really useful functions in there, but finding them was next to impossible.

At least our workstations had a built-in editor and we didn't have to use vi.

The only bug I know of with the kernel/shell is what happens when you run out of hard disk space (on any partition). At some locations the sysops re-partition the drives on a daily basis to try to keep that from happening.

Now that I think about it, that's it. I was trying to remember what it was
that also stood for the user's home directory.

I didn't mention this, but the shell I often use is ksh, the Korn shell. I
occasionally run csh for its abilities to change my username while I'm
using the online newsreader, tin.

From the little I can remember of Basic Cpu_Mod will be the call address so you need something like this (error checking omitted) ...

```
main()
{void    (*Cpu_Mod)();
 int h    =Fopen("CPU_MOD.BIN",0);
 long    n;

 /* do bload */
 n = Fseek(0,h,SEEK_END);
 Cpu_Mod = Malloc(n);
 Fseek(0,h,SEEK_BEG);
 Fread(h,n,Cpu_Mod);
 Fclose(h);

 /* do call */
 (*Cpu_Mod)();

 /* more calls */

 /* losing the module */
 Mfree(Cpu_Mod);
 Cpu_Mod = NULL;   /* to denote it no longer valid */
}
```

The above assumes the module is position independant and returns no results. If it returns a long say, then you would declare "long (*Cpu_Mod)()" instead.

Also, you will need to cast Malloc() [typically declared as long] to the required function pointer type. I've never been able to remember the syntax for this and I have no references handy.
